Your submission for this review:

Investment required for new water infrastructure or upgrade of existing infrastructure should not be passed on the current or future consumers - this needs to be set up as a basis. Customers only pay for what they use and operational costs that goes into producing/manufacturing the product or services. The additional capital required for new infrastructure or upgrade of existing infrastructure needs to come from Government's investment priorities. In case where the Government has not planned in time to factor in the new or upgrade of existing infrastructure costs, it indicates an inefficiency in how they conduct the business. The public servants and the decision makers need to be held responsible and accountable for lack of this foresight. The other alternative to raise capital is to collect it from the public by issuing public shares. Based on the confidence of the public in the specific operations, there will be lots of people interested in investing for the purpose of new water infrastructure or upgrade of existing infrastructure in a fair and equitable manner. This mechanism will solve several problems: 1. Raise required investment for the water infrastructure projects, 2. Will benefit the consumers not having to pay the additional charge for product/services they do not use 3. Participation of the public in Government initiative, there by the Government don't have to rely on unethical conscription to the captivated consumers. 4. Government will gain citizen's trust.
