Hi IPART, My retailer has lowered my feed in tariff for several years now. Each year it gets put a 1 to 2 cents lower. I understand that IPART's benchmark has gotten lower. At the same time my energy rates have increase. I'm on a time of use plan and both the peak and off peak rates have increased each year, while the feed in tariff falls. I don't understand how this can be happening without consumers being ripped off. If the IPART benchmark has fallen, if I understand correctly because wholesale prices during the day are lower and retailers lower their feed-in payments this makes sense. However, shouldn't their off-peak rates also decline? Otherwise we are just getting ripped off by lower feed-in tariffs but higher off peak rates?
