Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Asbestos analysed by: ASET, NATA accreditation no. 14484, report reference:ASET39956/43136/1-16

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	Yes

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of sixteen samples forwarded by Eurofins | MGT on 24 June 2014, for analysis for asbestos.

1.Introduction: Sixteen samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method **(Safer Environment Method 1 and Australian Guidelines AS 4964 - 2004 and WA/ NEPM Guidelines)**

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia/ NEPM Guidelines for the Assessment Remediation and Management of Asbestos in contaminated sites.

3. Results : **Sample No. 1. ASET39956 / 43136 / 1. #27-TP02 (0-0.1) - Jn18236.**
Approx dimensions 10.0 cm x 10.0 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 2. ASET39956 / 43136 / 2. #27-G-TP03 (0-0.1) - Jn18240.
Approx dimensions 12.0 cm x 11.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 3. ASET39956 / 43136 / 3. #27-G-TP05 (0-0.1) - Jn18245.
Approx dimensions 11.0 cm x 11.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 4. ASET39956 / 43136 / 4. #27-G-TP06 (1.0-1.1) - Jn18249.
Approx dimensions 11.0 cm x 10.5 cm x 5.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 5. ASET39956 / 43136 / 5. #25-G-TP02 (0.3-0.4) - Jn18252.
Approx dimensions 10.5 cm x 10.5 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 6. ASET39956 / 43136 / 6. #27-TP07 (0-0.1) - Jn18257.
Approx dimensions 12.0 cm x 11.0 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 7. ASET39956 / 43136 / 7. QC05 - Jn18259.
Approx dimensions 12.0 cm x 12.0 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 8. ASET39956 / 43136 / 8. #26-TP03 (0.5-0.6) - Jn18261.
Approx dimensions 12.0 cm x 12.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 9. ASET39956 / 43136 / 9. #26-TP04 (0.0-0.1) - Jn18262.
Approx dimensions 10.0 cm x 10.0 cm x 6.0 cm
The sample consisted of a mixture of sandy soil, stones and plant matter.
No asbestos detected.

Sample No. 10. ASET39956 / 43136 / 10. #26-TP05(0.0-0.1) - Jn18265.
Approx dimensions 11.0 cm x 10.0 cm x 5.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 11. ASET39956 / 43136 / 11. #26-TP06 (0.5-0.6) - Jn18269.
Approx dimensions 12.0 cm x 12.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 12. ASET39956 / 43136 / 12. #26-HA02 (0.0-0.1) - Jn18273.
Approx dimensions 10.5 cm x 10.5 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 13. ASET39956 / 43136 / 13. #26-SS01 (0.0-0.1) - Jn18280.
Approx dimensions 10.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 14. ASET39956 / 43136 / 14. #26-SS02 (0.0-0.1) - Jn18281.
Approx dimensions 10.0 cm x 9.0 cm x 5.2 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster, cement and brick.
No asbestos detected.

Sample No. 15. ASET39956 / 43136 / 15. #17-SP-TP01 (0-0.1) - Jn18282.
Approx dimensions 12.0 cm x 10.0 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 16. ASET39956 / 43136 / 16. #17-SP-TP02 (0-0.1) - Jn18284.
Approx dimensions 11.0 cm x 11.0 cm x 5.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Analysed and reported by,

Nisansala Maddage. BSc(Hons)
Environmental Scientist/Approved Identifier
Approved Signatory

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation covers only the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibres of relevant asbestos detected in Soil/ Dust.

***denotes fibres in bonded form in fragments**

All samples indicating " No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Zinc	0.005	mg/L	< 0.005	-	-	< 0.005

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jun 26, 2014	7 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jun 26, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jun 26, 2014	7 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jun 23, 2014	7 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jun 23, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Eurofins | mgt Suite 13			
Organochlorine Pesticides	Sydney	Jun 23, 2014	7 Day
- Method: E013 Organochlorine Pesticides (OC)			
Polychlorinated Biphenyls (PCB)	Sydney	Jun 23, 2014	7 Day
- Method: E013 Polychlorinated Biphenyls (PCB)

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	Yes

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	02213-15
Turn around time:	5 Day
Date/Time received:	Jun 20, 2014 3:50 PM
Eurofins | mgt reference:	**422618**

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 16.5 degrees Celsius.
- ☑ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Sample containers for volatile analysis received with zero headspace.
- ☑ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

SPCOAS conducted at Eurofins | mgt Brisbane | Acid Herbicides conducted at Eurofins | mgt Melbourne | Asbestos conducted at ASET | Asbestos bags not received for 27-G-TP06 (0-0.1), 27-G-TP06 (1.0-1.1), 26-HA01 (0-0.1) and 26-HA01 (0.3-0.4) | Labelling discrepancy: #26-TP03 (0.1-0.2) labelled as #26-TP03 (0-0.1) as per COC

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jun 26, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Asbestos analysed by: ASET, NATA accreditation no. 14484, report reference:ASET40033/43213/1-12

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	Yes

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Eurofins | MGT
Unit F3, Building F, 16 Mars Road
Lane Cove NSW 2066

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of twelve samples, forwarded by Eurofins | MGT on 27 June 2014, for analysis for asbestos.

1.Introduction: Twelve samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method **(Safer Environment Method 1 and Australian Guidelines AS 4964 - 2004 and WA/ NEPM Guidelines**)

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia/ NEPM Guidelines for the Assessment Remediation and Management of Asbestos in contaminated sites.

3. Results : **Sample No. 1. ASET40033 / 43213 / 1. QC06 - Jn21222.**
Approx dimensions 9.4 cm x 9.1 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 2. ASET40033 / 43213 / 2. 17 - TP03 - 0.2 - 0.3 - Jn21227.
Approx dimensions 9.7 cm x 8.6 cm x 8.4 cm
The sample consisted of a mixture of sandy clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 3. ASET40033 / 43213 / 3. 17 - TP04 - 0 - 0.1 - Jn21231.
Approx dimensions 8.8 cm x 8.7 cm x 8.3 cm
The sample consisted of a mixture of sandy clayish soil, stones, sandstones and plant matter.
No asbestos detected.

Sample No. 4. ASET40033 / 43213 / 4. 17 - TP05 - 0 - 0.1 - Jn21233.
Approx dimensions 8.7 cm x 8.5 cm x 8.1 cm
The sample consisted of a mixture of sandy clayish soil, stones, sandstones, plant matter and fragments of shale.
No asbestos detected.

Sample No. 5. ASET40033 / 43213 / 5. 09 - TP02 - 0 - 0.1 - Jn21238.
Approx dimensions 8.9 cm x 8.6 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 6. ASET40033 / 43213 / 6. 09 - TP04 - 0 - 0.1 - Jn21241.
Approx dimensions 9.2 cm x 8.6 cm x 7.7 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 7. ASET40033 / 43213 / 7. 09 - TP05 - 0 - 0.1 - Jn21243.
Approx dimensions 8.7 cm x 8.5 cm x 7.9 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 8. ASET40033 / 43213 / 8. 09 - A - TP06 - 0 - 0.1 - Jn21246.
Approx dimensions 8.8 cm x 8.6 cm x 8.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 9. ASET40033 / 43213 / 9. 09 - A - TP07 - 0 - 0.1 - Jn21249.
Approx dimensions 9.1 cm x 8.6 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 10. ASET40033 / 43213 / 10. 09 - A - TP08 - 0 - 0.1 - Jn21251.
Approx dimensions 9.3 cm x 8.5 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of shale.
No asbestos detected.

Sample No. 11. ASET40033 / 43213 / 11. 16 - TP01 - 0 - 0.1 - Jn21255.
Approx dimensions 8.8 cm x 8.7 cm x 8.3 cm
The sample consisted of a mixture of sandy clayish soil, stones, sandstones and plant matter.
No asbestos detected.

Sample No. 12. ASET40033 / 43213 / 12. 16 - TP02 - 0 - 0.1 - Jn21259.
Approx dimensions 9.2 cm x 8.8 cm x 8.6 cm
The sample consisted of a mixture of sandy clayish soil, stones, sandstones and plant matter.
No asbestos detected.

Laxman Dias. BSc
Analyst / Approved Identifier.
Approved Signatory

WORLD RECOGNISED
ACCREDITATION

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation covers only the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibres of relevant asbestos detected in Soil/ Dust.

***denotes fibres in bonded form in fragments**

All samples indicating " No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram
ug/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	Yes

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	Not provided
Turn around time:	5 Day
Date/Time received:	Jun 24, 2014 4:30 PM
Eurofins | mgt reference:	**422956**

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 16.5 degrees Celsius.
- ☑ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Sample containers for volatile analysis received with zero headspace.
- ☑ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

SPOCAS conducted at Eurofins mgt Brisbane| Asbestos conducted at ASET| Extra bag received, 16-TP01 1.4-1.5 has been placed on hold.

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jun 27, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jun 26, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jun 27, 2014	14 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jun 27, 2014	14 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jun 26, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Eurofins | mgt Suite 13			
Organochlorine Pesticides	Sydney	Jun 27, 2014	14 Day
- Method: E013 Organochlorine Pesticides (OC)			
Polychlorinated Biphenyls (PCB)	Sydney	Jun 27, 2014	28 Day
- Method: E013 Polychlorinated Biphenyls (PCB)			
Acid Herbicides	Melbourne	Jun 26, 2014	14 Day
- Method: MGT 530			
Ammonia (as N)	Sydney	Jun 26, 2014	28 Day
- Method: E036/E050 Ammonia as N			
Nitrate (as N)	Sydney	Jun 27, 2014	28 Day
- Method: E037 /E051 Nitrate as N			
pH (1:5 Aqueous extract)	Sydney	Jun 27, 2014	7 Day
- Method: E018.2 pH			
Total Organic Carbon	Melbourne	Jun 30, 2014	28 Day
- Method: APHA 5310B Total Organic Carbon			
Phosphorus	Sydney	Jun 26, 2014	180 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Thermotolerant Coliforms	Melbourne	Jun 26, 2014	72 Hour
- Method: Inhouse: Thermotolerant Coliforms in Soil by MPN*			
% Moisture	Sydney	Jun 26, 2014	28 Day
- Method: E005 Moisture Content			
Eurofins | mgt Micro Suite 3	Melbourne	Jun 26, 2014	72 Hour

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Asbestos: ASET Pty Ltd, NATA accreditation number 14484, report number : ASET40034/ 43214 / 1 - 20

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	Yes

Qualifier Codes/Comments

Code	Description
M10	NATA accreditation does not cover the performance of this service in soil matrices
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Eurofins | MGT
Unit F3, Building F, 16 Mars Road
Lane Cove NSW 2066

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of twenty samples, forwarded by Eurofins | MGT on 27 June 2014, for analysis for asbestos. This report supersedes the report issued earlier today.

1.Introduction: Twenty samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method **(Safer Environment Method 1 and Australian Guidelines AS 4964 - 2004 and WA/ NEPM Guidelines**)

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia/ NEPM Guidelines for the Assessment Remediation and Management of Asbestos in contaminated sites.

3. Results : **Sample No. 1. ASET40034 / 43214 / 1. #20 - TP01(0 - 0.1) - Jn21267.**
Approx dimensions 8.7 cm x 8.6 cm x 84 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 2. ASET40034 / 43214 / 2. #20 - TP02(0 - 0.1) - Jn21270.
Approx dimensions 8.5 cm x 8.3 cm x 7.6 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of cement and debris.
No asbestos detected.

Sample No. 3. ASET40034 / 43214 / 3. #20 - TP03(0 - 0.1) - Jn21272.
Approx dimensions 8.8 cm x 8.6 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 4. ASET40034 / 43214 / 4. #20 – TP04(0 - 0.1) - Jn21276.
Approx dimensions 9.1 cm x 8.5 cm x 8.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 5. ASET40034 / 43214 / 5. #20 - TP05(0.4 - 0.5) - Jn21280.
Approx dimensions 8.4 cm x 8.2 cm x 7.5 cm
The sample consisted of a mixture of soil, plant matter and wood chips.
No asbestos detected.

Sample No. 6. ASET40034 / 43214 / 6. #20 - TP06(0 - 0.1) - Jn21282.
Approx dimensions 8.7 cm x 8.5 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 7. ASET40034 / 43214 / 7. #20 - TP07(0 - 0.1) - Jn21284.
Approx dimensions 8.6 cm x 8.3 cm x 8.2 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plastic.
No asbestos detected.

Sample No. 8. ASET40034 / 43214 / 8. #20 - TP09(0.8 - 0.9) - Jn21287.
Approx dimensions 8.5 cm x 8.2 cm x 7.5 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster, cement and brick.
No asbestos detected.

Sample No. 9. ASET40034 / 43214 / 9. #20 - TP08(0 - 0.1) - Jn21288.
Approx dimensions 8.6 cm x 8.5 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 10. ASET40034 / 43214 / 10. #20 - TP08(0.4 - 0.5) - Jn21289.
Approx dimensions 8.7 cm x 8.4 cm x 8.2 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of shale.
No asbestos detected.

Sample No. 11. ASET40034 / 43214 / 11. #20 - TP11(0 - 0.1) - Jn21292.
Approx dimensions 8.4 cm x 8.3 cm x 7.6 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of bitumen, corroded metal and shale.
No asbestos detected.

Sample No. 12. ASET40034 / 43214 / 12. #20 - TP12(0 - 0.1) - Jn21294.
Approx dimensions 8.5 cm x 8.1 cm x 7.9 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, plastic, corroded metal and shale.
No asbestos detected.

Sample No. 13. ASET40034 / 43214 / 13. #19 - TP01(0 - 0.1) - Jn21296.
Approx dimensions 8.7 cm x .6 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 14. ASET40034 / 43214 / 14. #19 - TP02(0 - 0.1) - Jn21299.
Approx dimensions 8.4 cm x 8.7 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plastic and debris.
No asbestos detected.

Sample No. 15. ASET40034 / 43214 / 15. #19 - TP04(0 - 0.1) - Jn21300.
Approx dimensions 8.5 cm x 8.4 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 16. ASET40034 / 43214 / 16. #19 - TP05(0 - 0.1) - Jn21302.
Approx dimensions 8.9 cm x 8.7 cm x 8.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 17. ASET40034 / 43214 / 17. #19 - TP06(0 - 0.1) - Jn21303.
Approx dimensions 8.7 cm x 8.6 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 18. ASET40034 / 43214 / 18. QC07 - Jn21305.
Approx dimensions 8.8 cm x 8.5 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of shale.
No asbestos detected.

Sample No. 19. ASET40034 / 43214 / 19. QC08 - Jn21306.
Approx dimensions 8.6 cm x 8.5 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of shale.
No asbestos detected.

Sample No. 20. ASET40034 / 43214 / 20. #19 - TP03(0 - 0.1) - Jn21307.
Approx dimensions 8.4 cm x 8.3 cm x 7.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Analysed and reported by,

Laxman Dias. BSc
Analyst / Approved Identifier
Approved Signatory

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation covers only the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibres of relevant asbestos detected in Soil/ Dust.

*denotes fibres in bonded form in fragments

All samples indicating " No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	02219-02221
Turn around time:	5 Day
Date/Time received:	Jun 25, 2014 4:30 PM
Eurofins | mgt reference:	**422958**

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 16.5 degrees Celsius.
- ☒ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

Microbiological analysis, TOC and Acid Herb conducted at Eurofins | mgt Melbourne | Asbestos conducted at ASET | SPOCAS conducted at Eurofins | mgt Brisbane | Extra sample received, #19-TP03 (0.4-0.5), placed on hold

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

JBS & G (NSW & WA) Pty Ltd

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Attention:	Tyler Creese
Report:	423116-S
Client Reference:	**BOX HILL 43376**
Received Date:	25 June 2014
Date Reported:	4 July 2014

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, "Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise" therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Sample History
Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters is performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis.
7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.
Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.
**NOTE: pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per kilogram
µg/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Nephelometric Turbidity Units

TERMS

Dry	Where moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the client's batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed on fireproofing, troweled on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).

Newcastle

PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substantial degree of damage which increases the potential for fibre release.)
AC	asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios)

QC - ACCEPTANCE CRITERIA

RPD Duplicates:	Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:
Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%
Surrogate Recoveries:	Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and its Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time.
7. Analysis will begin as soon as possible after sample receipt.
8. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
9. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS's.
10. For Matrix Spikes and LCS results a dash “-" in the report means that the specific analyte was not added to the QC sample.
11. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Eurofins | mgt Internal Quality Control Review and Glossary

General
1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times
Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS
mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA
RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS
1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Tyler Creese
Client job number:	BOX HILL 43376
COC number:	02222-022223
Turn around time:	5 Day
Date/Time received:	Jun 25, 2014 5:00 PM
Eurofins | mgt reference:	**423116**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 11.5 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Acid Herbicide and CEC conducted at Eurofins | mgt Melbourne | SPOCAS conducted at Eurofins | mgt Brisbane

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Tyler Creese - TCreese@jbsg.com.au.

Mercury	0.05	mg/kg	-	< 0.05
Nickel	5	mg/kg	-	< 5
Zinc	5	mg/kg	-	7.0

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 03, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 02, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jul 03, 2014	14 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jul 03, 2014	14 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jul 02, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Volatile Organics	Sydney	Jul 01, 2014	7 Day
- Method: E016 Volatile Organic Compounds (VOC)			
Acid Herbicides	Melbourne	Jul 03, 2014	14 Day
- Method: MGT 530			
Organophosphorus Pesticides (OP)	Sydney	Jul 03, 2014	14 Day
- Method: E014 Organophosphorus Pesticides (OP)			
pH (1:5 Aqueous extract)	Sydney	Jul 03, 2014	7 Day
- Method: E018.2 pH			
% Moisture	Brisbane	Jul 04, 2014	14 Day
- Method: Method 102 - ANZECC - % Moisture			
Asbestos - WA guidelines	Sydney	Jun 30, 2014	0 Day
Ion Exchange Properties	Melbourne	Jul 03, 2014	
Eurofins | mgt Suite 13			
Organochlorine Pesticides	Sydney	Jul 03, 2014	14 Day
- Method: E013 Organochlorine Pesticides (OC)			
Polychlorinated Biphenyls (PCB)	Sydney	Jul 03, 2014	28 Day
- Method: E013 Polychlorinated Biphenyls (PCB)			
SPOCAS Suite			
SPOCAS Suite	Brisbane	Jul 04, 2014	6 Week
- Method: LTM-GEN-7050			
Extraneous Material	Brisbane	Jul 04, 2014	0 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
R16	The LORs have been raised due to the high concentration of one or more analytes
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Attention:	Ken Henderson
Report:	423382-S
Client Reference:	**BOX HILL 43367**
Received Date:	27 June 2014
Date Reported:	8 July 2014

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, “Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise” therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Sample History
Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters is performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis.
7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.
Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.
**NOTE: pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per kilogram
µg/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Nephelometric Turbidity Units

TERMS

Dry	Where moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the client’s batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed on fireproofing, troweled on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).

PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substantial degree of damage which increases the potential for fibre release.)
AC	asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios)

QC - ACCEPTANCE CRITERIA

RPD Duplicates:	Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:
Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%
Surrogate Recoveries:	Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and its Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time.
7. Analysis will begin as soon as possible after sample receipt.
8. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
9. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS's.
10. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
11. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 01, 2014	7 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jun 30, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jul 01, 2014	7 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jul 01, 2014	7 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jun 30, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Eurofins | mgt Suite 13			
Organochlorine Pesticides	Sydney	Jul 01, 2014	7 Day
- Method: E013 Organochlorine Pesticides (OC)			
Polychlorinated Biphenyls (PCB)	Sydney	Jul 01, 2014	7 Day
- Method: E013 Polychlorinated Biphenyls (PCB)

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43367
COC number:	02224-02228
Turn around time:	5 Day
Date/Time received:	Jun 27, 2014 4:38 PM
Eurofins | mgt reference:	**423382**

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 11 degrees Celsius.
- ☑ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Sample containers for volatile analysis received with zero headspace.
- ☒ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

#8-SED02 not received, analysis cancelled | SPCOAS conducted at Eurofins mgt Brisbane | CEC and Acid Herbicides conducted at Eurofins | mgt Melbourne | Bag not received for sample #20-SD-SS08 and #18-TP03 (0.3-0.4), Asbestos analysis cancelled

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Subject: Re: Query samples for job Box Hill 43367

Hi, sorry about the discrepancies.

All the COC changes you listed are correct. #18-TP03 is 0.3 - 0.4. And disregard the same with the x on it. It shouldn't have been included.

Thanks,

Tyler

Ok thanks. Neither samples require asbestos testing. Could you please ensure the following have asbestos analysis selected:

#20-sd-ss01
#20-sd-ss09
#20-sd-ss10

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 07, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 07, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jul 07, 2014	14 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jul 07, 2014	14 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jul 07, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS			
Volatile Organics	Sydney	Jul 07, 2014	7 Day
- Method: E016 Volatile Organic Compounds (VOC)			
pH (1:5 Aqueous extract)	Sydney	Jul 08, 2014	7 Day
- Method: E018.2 pH			
% Moisture	Sydney	Jul 07, 2014	28 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention:	Ken Henderson
Report:	423678-S
Client Reference:	**BOX HILL 43376**
Received Date:	1 July 2014
Date Reported:	11 July 2014

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, "Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise" therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters is performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis.
7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.
Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.
**NOTE: pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per kilogram
µg/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Nephelometric Turbidity Units

TERMS

Dry	Where moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the client's batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed on fireproofing, troweled on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).

Newcastle

PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substantial degree of damage which increases the potential for fibre release.)
AC	asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios)

QC - ACCEPTANCE CRITERIA

RPD Duplicates:	Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:
Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%
Surrogate Recoveries:	Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and its Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time.
7. Analysis will begin as soon as possible after sample receipt.
8. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
9. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS's.
10. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
11. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 02, 2014	7 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 02, 2014	14 Day
- Method: E029/E016 BTEX			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Jul 02, 2014	7 Day
- Method: LM-LTM-ORG2010			
Polycyclic Aromatic Hydrocarbons	Sydney	Jul 02, 2014	7 Day
- Method: E007 Polyaromatic Hydrocarbons (PAH)			
Metals M8	Sydney	Jul 02, 2014	28 Day
- Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	02229-02230
Turn around time:	5 Day
Date/Time received:	Jul 1, 2014 12:15 PM
Eurofins | mgt reference:	**423678**

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 14 degrees Celsius.
- ☑ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Sample containers for volatile analysis received with zero headspace.
- ☒ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Notes

CEC conducted at Eurofins | mgt Melbourne | SPOCAS conducted at Eurofins | mgt Brisbane | 312-SED01 labelled as #12-SED02 as per COC

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 08, 2014	14 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

NSW 2000

Attention:	Ken Henderson
Report:	423743-S
Client Reference:	**BOX HILL 43376**
Received Date:	1 July 2014
Date Reported:	11 July 2014

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, "Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise" therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters is performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis.
7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.
Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.
**NOTE: pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per kilogram
µg/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Nephelometric Turbidity Units

TERMS

Dry	Where moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the client’s batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed on fireproofing, troweled on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).

Newcastle

PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substantial degree of damage which increases the potential for fibre release.)
AC	asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios)

QC - ACCEPTANCE CRITERIA

RPD Duplicates:	Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:
Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%
Surrogate Recoveries:	Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and its Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time.
7. Analysis will begin as soon as possible after sample receipt.
8. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
9. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS's.
10. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
11. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample S14-Jl2436: Insufficient sample provided; the supplied sample volume was considerably below the recommended volume of 500 mL as per 'Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia 2009'. The result may not be a true indication of the sampled area due to the small sample size and can lead to an inaccurate interpretation.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	Not provided
Turn around time:	5 Day
Date/Time received:	Jul 1, 2014 3:50 PM
Eurofins | mgt reference:	**423743**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 8 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Extra sample received, 11- SP- TP04 0.2-0.3 has been placed on hold| Acid Herbicide and CEC conducted at Eurofins mgt Melbourne| SPOCAS conducted at Eurofins mgt Brisbane.

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

JBS & G (NSW & WA) Pty Ltd

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 11, 2014	14 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q02	The duplicate %RPD is outside the recommended acceptance criteria. Further analysis indicates sample heterogeneity as the cause
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Attention:	Ken Henderson
Report:	423820-S
Client Reference:	**BOX HILL 43376**
Received Date:	2 July 2014
Date Reported:	14 July 2014

Methodology:

Asbestos ID	Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques. Bulk samples include building materials, soils and ores.
Subsampling Soil Samples	The whole sample submitted is first dried and then sieved through a 10mm sieve followed by a 2mm sieve. All fibrous matter viz greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) Iron ores - Sampling and Sample preparation procedures is employed. Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis in accordance with AS 4964-2004.
Bonded asbestos-containing material (ACM)	The material is first examined and any fibres isolated and where required interfering organic fibres or matter may be removed by treating the sample for several hours at a temperature not exceeding 400 ± 30°C. The resultant material is then ground and examined in accordance with AS 4964-2004.
Limit of Reporting	The nominal detection limit of the AS4964 method is around 0.01%. The examination of large sample sizes (at least 500 ml is recommended) may improve the likelihood of identifying asbestos material in the greater than 2 mm fraction. The NEPM screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. NOTE: NATA News, September 2011 – page 34, states, "Weighing of fibres is problematic and can lead to loss of fibres and potential exposure for laboratory analysts. To request laboratories to report information which is outside the scope of AS 4964-2004 and the scope of their accreditation is misleading and is most unwise" therefore such values reported are outside the scope of Eurofins | mgt NATA accreditation as designated by an asterisk.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters is performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis.
7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).
For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.
If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.
Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.
**NOTE: pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per kilogram
µg/l: micrograms per litre
ppb: Parts per billion
org/100ml: Organisms per 100 millilitres
MPN/100mL: Most Probable Number of organisms per 100 millilitres
mg/l: milligrams per litre
ppm: Parts per million
%: Percentage
NTU: Nephelometric Turbidity Units

TERMS

Dry	Where moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the client’s batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient
ACM	Bonded asbestos-containing material means any material containing more than 1% asbestos and comprises asbestos-containing-material which is in sound condition, although possibly broken or fragmented, and where the asbestos is bound in a matrix such as cement or resin. Common examples of ACM include but are not limited to: pipe and boiler insulation, sprayed on fireproofing, troweled on acoustical plaster, floor tile and mastic, floor linoleum, transite shingles, roofing materials, wall and ceiling plaster, ceiling tiles, and gasket materials. This term is restricted to material that cannot pass a 7 mm x 7 mm sieve. This sieve size is selected because it approximates the thickness of common asbestos cement sheeting and for fragments to be smaller than this would imply a high degree of damage and hence potential for fibre release.
FA	FA comprises friable asbestos material and includes severely weathered cement sheet, insulation products and woven asbestos material. This type of friable asbestos is defined here as asbestos material that is in a degraded condition such that it can be broken or crumbled by hand pressure. This material is typically unbonded or was previously bonded and is now significantly degraded (crumbling).

PACM	Presumed Asbestos-Containing Material means thermal system insulation and surfacing material found in buildings, vessels, and vessel sections constructed no later than 1980 that are assumed to contain greater than one percent asbestos but have not been sampled or analyzed to verify or negate the presence of asbestos.
AF	Asbestos fines (AF) are defined as free fibres, or fibre bundles, smaller than 7mm. It is the free fibres which present the greatest risk to human health, although very small fibres (< 5 microns in length) are not considered to be such a risk. AF also includes small fragments of bonded ACM that pass through a 7 mm x 7 mm sieve. (Note that for bonded ACM fragments to pass through a 7 mm x 7 mm sieve implies a substantial degree of damage which increases the potential for fibre release.)
AC	asbestos cement means a mixture of cement and asbestos fibres (typically 90:10 ratios)

QC - ACCEPTANCE CRITERIA

RPD Duplicates:	Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:
Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%
Surrogate Recoveries:	Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and its Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time.
7. Analysis will begin as soon as possible after sample receipt.
8. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
9. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS's.
10. For Matrix Spikes and LCS results a dash “-" in the report means that the specific analyte was not added to the QC sample.
11. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	No
Sample correctly preserved	Yes
Organic samples had Teflon liners	N/A
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within Holding Time	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 03, 2014	7 Day
- Method: E004 Petroleum Hydrocarbons (TPH)

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	No
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 15 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☒ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

Please see attached email for discrepancies| Jars not received for#3-SD-SS01, #3-A-SS02-, #3-A-SS03 and #3-A-SS04. Analysis cancelled except for Asbestos| Bag not received for #3-S-SS21.Asbestos analysis cancelled.

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Subject: Box Hill 43376

Hi Tyler,

I found the #17 samples in another esky so that's fine. Please see below for the discrepancies:

Rinsate- Only a 1x1L amber received

Missing- 3-D-SS01 (Bag and jar), 3ASS02(jar), 3ASS03(Jar), 3ASS04 (Jar), #21-TP03 (0.3-0.4)- double labelled jar, #22_TP01 0-0.1- Might be double labelled jar, 3-S-SS21 (Missing bag)

Extra samples received- #21-TP01 0.4-0.5 (bag and Jar), #3-SS14 (Bag and Jar), #3-O-SS03 (Bag), #10-TP04 (Bag), #10-SD-SS02 (Bag and Jar), #3-SD-SS01.

Other labelling discrepancies

COC: #10-TP04 0.2-0.3, Jar# 10-TP04 0.3-0.4. We have labelled as per the COC
COC:#21-TP02 0.3-0.4, Jar:#21-TP02 0.4-0.5. We have labelled as per the COC

COC/BAG: #22-TP02 0.3-0.4 (Correct), Jar: TP02 0.4-0.5. We have labelled the jar as per the bag.

Subject: Re: Box Hill 43376

Hopefully this clears it up:

- can all rinsate analyses be conducted from Amber (?)

- there is no #3-d-ss01. It is #3-sd-ss01

- please test 10-sd-ss02 for B7, B13, asbestos

- put 10-sd- tp04 on for asbestos

- disregard the unlabelled jar.

- never mind analysis on additional samples

Does this clear most up?

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 09, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 09, 2014	14 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Eurofins | MGT
Unit F3, 16 Mars Road
Lane Cove NSW 2066

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of nineteen samples, forwarded by Eurofins | MGT on 10 July 2014, for analysis for asbestos.

1.Introduction: Nineteen samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method **(Safer Environment Method 1 and Australian Guidelines AS 4964 - 2004 and WA/ NEPM Guidelines**)

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia/ NEPM Guidelines for the Assessment Remediation and Management of Asbestos in contaminated sites.

3. Results : **Sample No. 1. ASET40231 / 43411 / 1. #22-TP04 (0-0.1) - JI04546.**
Approx dimensions 12.0 cm x 12.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 2. ASET40231 / 43411 / 2. #21-SP-TP06 (0.4-0.5) – JI04550
Approx dimensions 14.0 cm x 14.0 cm x 5.0 cm
The sample consisted of a mixture of soil, stones, sandstones, plant matter, fragments of plaster and cement.
No asbestos detected.

Sample No. 3. ASET40231 / 43411 / 3. #21-TP07 (0.3-0.4) – JI04552
Approx dimensions 13.0 cm x 13.0 cm x 5.3 cm
The sample consisted of a mixture of clayish soil, stones, shale, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 4. ASET40231 / 43411 / 4. #21-TP08 (0.3-0.4) – JI04554
Approx dimensions 12.5 cm x 12.5 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and brick.
No asbestos detected.

SUITE 710 / 90 GEORGE STREET, HORNSBY NSW 2077 – P.O. BOX 1644 HORNSBY WESTFIELD NSW 1635
PHONE: (02) 99872183 FAX: (02)99872151 EMAIL: aset@bigpond.net.au WEBSITE: www.Ausset.com.au

Sample No. 5. ASET40231 / 43411 / 5. #21-TP09 (0.3-0.4) – JI04556
Approx dimensions 13.0 cm x 13.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and brick.
No asbestos detected.

Sample No. 6. ASET40231 / 43411 / 6. #21-SS01 - JI04560.
Approx dimensions 10.0 cm x 8.0 cm x 5.0 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster, brick, paint flakes and corroded metal.
No asbestos detected.

Sample No. 7. ASET40231 / 43411 / 7. #14-SD -TP02 (0-0.1) – JI04563.
Approx dimensions 10.0 cm x 10.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and brick.
No asbestos detected.

Sample No. 8. ASET40231 / 43411 / 8. #14-SD-TP04 (0-0.1) – JI04564 .
Approx dimensions 14.0 cm x 14.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 9. ASET40231 / 43411 / 9. #5- SS01 – JI04568 .
Approx dimensions 14.0 cm x 12.5 cm x 5.6 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster, brick and corroded metal.
No asbestos detected.

Sample No. 10. ASET40231 / 43411 / 10. #5- SS02– JI04569 .
Approx dimensions 13.0 cm x 12.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and brick.
No asbestos detected.

Sample No. 11. ASET40231 / 43411 / 11. #5-A - SS03 – JI04570.
Approx dimensions 10.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and brick.
No asbestos detected.

Sample No. 12. ASET40231 / 43411 / 12. #5- A -SS04 – JI04571.
Approx dimensions 10.1 cm x 10.0 cm x 5.1 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster, cement, brick and pieces of glass.
No asbestos detected.

Sample No. 13. ASET40231 / 43411 / 13. #4- A- SS11 – JI04586.
Approx dimensions 12.0 cm x 12.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, cement, brick, corroded metal and glass.
No asbestos detected.

Sample No. 14. ASET40231 / 43411 / 14. #4-A- SS13– JI04588.
Approx dimensions 12.0 cm x 12.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 15. ASET40231 / 43411 / 15. #4-A - SS15 – JI04590.
Approx dimensions 11.0 cm x 11.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 16. ASET40231 / 43411 / 16. #4-A - SS16 – JI04591 .
Approx dimensions 10.5 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 17. ASET40231 / 43411 / 17. #4-A - SS17 – JI04592 .
Approx dimensions 10.0 cm x 10.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 18. ASET40231 / 43411 / 18. #4-A - SS19 – JI04594 .
Approx dimensions 11.0 cm x 10.0 cm x 4.8 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 19. ASET40231 / 43411 / 19. #4-A – SS20 – JI04595.
Approx dimensions 12.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

WORLD RECOGNISED ACCREDITATION

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation covers only the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibres of relevant asbestos detected in Soil/ Dust.

***denotes fibres in bonded form in fragments**

All samples indicating " No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025. The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	Not provided
Turn around time:	5 Day
Date/Time received:	Jul 3, 2014 4:10 PM
Eurofins | mgt reference:	**424036**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 15 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

CEC and Acid Herb conducted at Eurofins | mgt Melbourne | SPOCAS conducted at Eurofins | mgt Brisbane

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 10, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 10, 2014	14 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
S02	Retained Acidity is Reported when the pHKCl is less than pH 4.5

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of twenty-nine samples, forwarded by Eurofins MGT on 10 July 2014, for analysis for asbestos.

1.Introduction: Twenty-nine samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method **(Safer Environment Method 1 and Australian Standards AS 4964 - 2004 and WA/ NEPM Guidelines)**

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia/NEPM Guidelines for the Assessment Remediation and Management of Asbestos in contaminated sites.

3. Results : **Sample No. 1. ASET40235 / 43415 / 1. #1-A-SS09 - Jl05602.**
Approx dimensions 10.0 cm x 10.0 cm x 4.0 cm
The sample consisted of a mixture of clayish soil, stones, fibres^, plant matter, fragments of plaster, cement, fibre cement*, brick and glass.
Chrysotile^* (Estimated approximate weight= 0.14g) asbestos, Amosite^* (Estimated approximate weight= 0.038g) asbestos and Crocidolite^* (Estimated approximate weight= 0.062g) asbestos detected.
Estimated approximate total weight of asbestos = 0.24g
Approximate total weight of asbestos (AF/loose fibres) = 0.18g
Estimated approximate total weight of asbestos in ACM (>7mm) = 0.06g
Approximate total weight of ACM (>7mm) = 0.4g
Approximate total weight of soil = 418.0g
Approximate % w/w for AF = 0.04%
Estimated approximate % w/w for ACM = 0.01%

Sample No. 2. ASET40235 / 43415 / 2. #1-SS12 - Jl05605.
Approx dimensions 10.0 cm x 10.0 cm x 4.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 3. ASET40235 / 43415 / 3. #1-SS14 - Jl05606.
Approx dimensions 10.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of soil, stones, plant matter, fragments of plaster and metal pieces.
No asbestos detected.

Sample No. 4. ASET40235 / 43415 / 4. #1-SS17 - Jl05609.
Approx dimensions 11.0 cm x 10.5 cm x 5.0 cm
The sample consisted of a mixture of sandy soil, stones and plant matter.
No asbestos detected.

Sample No. 5. ASET40235 / 43415 / 5. #1-SS18 - Jl05610.
Approx dimensions 10.0 cm x 9.0 cm x 5.2 cm
The sample consisted of a mixture of soil, stones and plant matter.
No asbestos detected.

Sample No. 6. ASET40235 / 43415 / 6. #1-A-SS20 - Jl05613.
Approx dimensions 10.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of soil, stones, fibres^, plant matter, fragments of plaster and glass.
Chrysotile^ (Approximate weight = 0.011g) asbestos, Amosite^ (Approximate weight = 0.004g) asbestos and Crocidolite^ (Approximate weight = 0.006g) asbestos detected.
Approximate total weight of asbestos (AF/loose fibres) = 0.021g
Approximate total weight of soil = 460.0g
Approximate % w/w = 0.005%

Sample No. 7. ASET40235 / 43415 / 7. #1-A-SS23 - Jl05616.
Approx dimensions 11.0 cm x 11.0 cm x 5.0. cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 8. ASET40235 / 43415 / 8. #1-A-SS24 - Jl05617.
Approx dimensions 12.0 cm x 12.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, cement and paint flakes.
No asbestos detected.

Sample No. 9. ASET40235 / 43415 / 9. #1-A-SS26 - Jl05619.
Approx dimensions 10.0 cm x 10.0 cm x 5.1 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 10. ASET40235 / 43415 / 10. #1-A-SS28 - JI05621.
Approx dimensions 10.0 cm x 10.0 cm x 5.1 cm
The sample consisted of a mixture of clayish soil, stones, fibres^, plant matter, paint flakes and fragments of plaster.
Chrysotile^ (Approximate weight= 0.0025g) asbestos, Amosite^ (Approximate weight= 0.001g) asbestos and Crocidolite^ (Approximate weight= 0.0008g) asbestos detected.
Approximate total weight of asbestos (AF/loose fibres) = 0.0043g
Approximate total weight of soil = 525.0g
Approximate % w/w = 0.0008%

Sample No. 11. ASET40235 / 43415 / 11. #1-A-SS29 - JI05622.
Approx dimensions 10.0 cm x 10.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, cement and paint flakes.
No asbestos detected.

Sample No. 12. ASET40235 / 43415 / 12. #1-A-SS30 - JI05623.
Approx dimensions 10.0 cm x 10.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and paint flakes.
No asbestos detected.

Sample No. 13. ASET40235 / 43415 / 13. #1-A-SS31 - JI05624.
Approx dimensions 12.0 cm x 12.0 cm x 4.5 cm
The sample consisted of a mixture of clayish soil, stones, fragments of plaster, cement, glass and paint flakes.
No asbestos detected.

Sample No. 14. ASET40235 / 43415 / 14. #1-A-SS32 - JI05625.
Approx dimensions 12.0 cm x 12.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, cement and paint flakes.
No asbestos detected.

Sample No. 15. ASET40235 / 43415 / 15. #1-A-SS01 - JI05626.
Approx dimensions 12.0 cm x 12.0 cm x 5.8 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 16. ASET40235 / 43415 / 16. Sample Missing.

Sample No. 17. ASET40235 / 43415 / 17. #12-A-SS02 - JI05628.
Approx dimensions 11.0 cm x 11.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 18. ASET40235 / 43415 / 18. #12-A-SS03 - Jl05629.
Approx dimensions 13.0 cm x 11.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 19. ASET40235 / 43415 / 19. #12-A-SS04 - Jl05630.
Approx dimensions 12.5 cm x 12.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster and paint flakes.
No asbestos detected.

Sample No. 20. ASET40235 / 43415 / 20. #12-A-SS05 - Jl05631.
Approx dimensions 12.0 cm x 12.0 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, brick and glass.
No asbestos detected.

Sample No. 21. ASET40235 / 43415 / 21. #23-HA01 (0-0.1) - Jl05637.
Approx dimensions 11.0 cm x 10.5 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 22. ASET40235 / 43415 / 22. #23-HA02 (0-0.1) - Jl05638.
Approx dimensions 10.0 cm x 10.0 cm x 5.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 23. ASET40235 / 43415 / 23. #23-HA03 (0-0.1) - Jl05639.
Approx dimensions 12.0 cm x 10.5 cm x 5.2 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 24. ASET40235 / 43415 / 24. #23-HA04 (0-0.1) - Jl05641.
Approx dimensions 10.0 cm x 10.0 cm x 4.4 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 25. ASET40235 / 43415 / 25. #25-F-SS01 - Jl05644.
Approx dimensions 10.0 cm x 10.0 cm x 4.7 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, paint flakes and corroded metal.
No asbestos detected.

Sample No. 26. ASET40235 / 43415 / 26. #25-S-SS02 - Jl05645.
Approx dimensions 10.0 cm x 10.0 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, corroded metal and fragments of plaster.
No asbestos detected.

Sample No. 27. ASET40235 / 43415 / 27. #25-SD-SS03 - Jl05646.
Approx dimensions 10.0 cm x 10.0 cm x 4.6 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 28. ASET40235 / 43415 / 28. #25-SD-SS04 - Jl05647.
Approx dimensions 10.5 cm x 10.2 cm x 5.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 29. ASET40235 / 43415 / 29. #24-SS03 - Jl05652.
Approx dimensions 10.0 cm x 10.0 cm x 6.0 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation only covers the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibres of relevant asbestos types detected in soil/dust.
*** denotes asbestos detected in ACM in bonded form.**

All samples indicating “No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Certificate of Analysis

NATA Accredited
Accreditation Number 1261
Site Number 18217

Accredited for compliance with ISO/IEC 17025.
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

JBS & G (NSW & WA) Pty Ltd

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 09, 2014	7 Day

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Ken Henderson
Client job number:	BOX HILL 43376
COC number:	Not provided
Turn around time:	5 Day
Date/Time received:	Jul 4, 2014 3:10 PM
Eurofins | mgt reference:	**424180**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 11.5 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Ken Henderson - khenderson@jbsgroup.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Jul 14, 2014	14 Day
- Method: E004 Petroleum Hydrocarbons (TPH)			
BTEX	Sydney	Jul 14, 2014	14 Day
- Method: E029/E016 BTEX

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram	**mg/l:** milligrams per litre
ug/l: micrograms per litre	**ppm:** Parts per million
ppb: Parts per billion	**%:** Percentage
org/100ml: Organisms per 100 millilitres	**NTU:** Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres	

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q15	The RPD reported passes Eurofins | mgt's Acceptance Criteria as stipulated in SOP 05. Refer to Glossary Page of this report for further details
R16	The LORs have been raised due to the high concentration of one or more analytes

WORLD RECOGNISED ACCREDITATION

15 July 2014

Eurofins | MGT
Unit F3, Building F, 16 Mars Road
Lane Cove NSW 2066

Attn: Dr Robert Symons

Dear Robert

Asbestos Identification
This report presents the results of nineteen samples, forwarded by Eurofins | MGT on 10 July 2014, for analysis for asbestos.

1.Introduction: Nineteen samples forwarded were examined and analysed for the presence of asbestos.

2. Methods : The samples were examined under a Stereo Microscope and selected fibres were analysed by Polarized Light Microscopy in conjunction with Dispersion Staining method.
(Safer Environment Method 1 and Australian Standard AS 4964-2004.)

This report is consistent with the analytical procedures and reporting recommendations in the Western Australia Guidelines for the Assessment Remediation and Management of Asbestos contaminated sites in Western Australia.

3. Results : **Sample No. 1. ASET40257 / 43437 / 1. #9 - SP - HA01(0.3 - 0.4) - Jl07664.**
Approx dimensions 9.2 cm x 8.6 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 2. ASET40257 / 43437 / 2. QC21 - Jl07665.
Approx dimensions 9.2 cm x 8.7 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 3. ASET40257 / 43437 / 3. #9 - SP - HA02(0 - 0.1) - Jl07666.
Approx dimensions 8.9 cm x 8.6 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 4. ASET40257 / 43437 / 4. #9 - HA05(0 - 0.1) - Jl07670.
Approx dimensions 9.2 cm x 8.7 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 5. ASET40257 / 43437 / 5. #9 - HA06(0 - 0.1) - Jl07671.
Approx dimensions 9.3 cm x 8.7 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of shale.
No asbestos detected.

PHONE: (02) 99872183 FAX: (02)99872151 EMAIL: aset@bigpond.net.au WEBSITE: www.Ausset.com.au

Sample No. 6. ASET40257 / 43437 / 6. #9 -HA07(0 - 0.1) - Jl07673.
Approx dimensions 9.2 cm x 8.7 cm x 8.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 7. ASET40257 / 43437 / 7. #9 - HA08(0 - 0.1) - Jl07676.
Approx dimensions 8.9 cm x 8.7 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of plaster.
No asbestos detected.

Sample No. 8. ASET40257 / 43437 / 8. #9 - SD - SS03 - Jl07679.
Approx dimensions 8.6 cm x 8.5 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 9. ASET40257 / 43437 / 9. #9 - SD - SS04 - Jl07680.
Approx dimensions 9.2 cm x 8.6 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, synthetic mineral fibres and fragments of coal like material.
No asbestos detected.

Sample No. 10. ASET40257 / 43437 / 10. #22 - A - SS01 - Jl07688.
Approx dimensions 8.6 cm x 8.4 cm x 8.2 cm
The sample consisted of a mixture of soil, stones, wood chips, plant matter and fragments of shale.
No asbestos detected.

Sample No. 11. ASET40257 / 43437 / 11. #22 - A - SS02 - Jl07689.
Approx dimensions 8.3 cm x 8.1 cm x 7.8 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 12. ASET40257 / 43437 / 12. #22 - A - SS03 - Jl07690.
Approx dimensions 8.5 cm x 7.8 cm x 7.6 cm
The sample consisted of a mixture of clayish soil, stones, plant matter and fragments of cement.
No asbestos detected.

Sample No. 13. ASET40257 / 43437 / 13. #22 - F - SS04 - Jl07691.
Approx dimensions 9.4 cm x 9.1 cm x 8.5 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fragments of plaster, cement and brick.
No asbestos detected.

Sample No. 14. ASET40257 / 43437 / 14. #22 - A - SS06 - Jl07693.
Approx dimensions 9.1 cm x 8.6 cm x 8.5 cm
The sample consisted of a mixture of sandy clayish soil, stones, plant matter, fragments of plaster and shale.
No asbestos detected.

Sample No. 15. ASET40257 / 43437 / 15. #28 - TP04(0 - 0.1) - Jl07694.
Approx dimensions 8.7 cm x 8.4 cm x 8.2 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 16. ASET40257 / 43437 / 16. #29 - TP05(0 - 0.1) - JI07695.
Approx dimensions 9.1 cm x 8.7 cm x 8.4 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 17. ASET40257 / 43437 / 17. #18 - SD - SS01 - JI07697.
Approx dimensions 8.7 cm x 8.5 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Sample No. 18. ASET40257 / 43437 / 18. #8 - SS01 - JI07698.
Approx dimensions 8.7 cm x 8.5 cm x 8.3 cm
The sample consisted of a mixture of clayish soil, stones, plant matter, fibres^ and fragments of bitumen.
Chrysotile^ (Approximate weight= 0.001g) asbestos detected.
Approximate total weight of asbestos = 0.001g.
Approximate total asbestos weight in AF(Loose fibres) = 0.001g.
Approximate total weight of soil = 738g.
Approximate w/w % = 0.0001%

Sample No. 19. ASET40257 / 43437 / 19. #3 - F - SS24 - JI07700.
Approx dimensions 8.8 cm x 8.7 cm x 8.6 cm
The sample consisted of a mixture of clayish soil, stones and plant matter.
No asbestos detected.

Approved Signatory

WORLD RECOGNISED ACCREDITATION

Accredited for compliance with ISO/IEC 17025.

The approx; weights given above can be used only as a guide. They do not represent absolute weights of each kind of asbestos as it is impossible to extract all loose fibres from soil and other asbestos containing building material samples using this method. However above figures may be used as closest approximations to the exact values in each case. Estimation and/ or reporting of asbestos fibre weights in asbestos containing materials and soil is out of the Scope of the NATA Accreditation. NATA Accreditation covers only the qualitative part of the results reported.

ACM - Asbestos Containing Material - Products or materials that contain asbestos in an inert bound matrix such as cement or resin. Here taken to be sound material, even as fragments and not fitting through a 7mm X 7 mm sieve.

AF -Includes asbestos free fibres, small fibre bundles and also ACM fragments that pass through a 7mm X 7 mm sieve.

FA -Friable asbestos material such as severely weathered ACM, and asbestos in the form of loose fibrous material such as insulation products.

^ denotes loose fibre bundle/s of relevant asbestos detected in Soil/ Dust.

All samples indicating " No asbestos detected" are assumed to be less than 0.001 % unless the actual approximate weight is given.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

mg/l: milligrams per litre

ug/l: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100ml: Organisms per 100 millilitres

NTU: Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Sample Receipt Advice

Company name:	**JBS & G (NSW & WA) Pty Ltd**
Contact name:	Kasey Hills
Client job number:	BOX HILL 43376
COC number:	02244-46
Turn around time:	5 Day
Date/Time received:	Jul 8, 2014 10:40 AM
Eurofins | mgt reference:	**424407**

Sample information

☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.

☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 12.5 degrees Celsius.

☑ All samples have been received as described on the above COC.

☑ COC has been completed correctly.

☑ Attempt to chill was evident.

☑ Appropriately preserved sample containers have been used.

☑ All samples were received in good condition.

☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.

☑ Organic samples had Teflon liners.

☑ Sample containers for volatile analysis received with zero headspace.

☒ Some samples have been subcontracted.

N/A Custody Seals intact (if used).

Notes

CEC conducted at Eurofins | mgt Melbourne | Asbestos bag not received for sample #16-SD-HA03(0-0.1), thus ASB analysis cancelled

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Kasey Hills - khills@jbsg.com.au.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Eurofins | mgt Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. Actual PQLs are matrix dependant. Quoted PQLs may be raised where sample extracts are diluted due to interferences.
4. Results are uncorrected for matrix spikes or surrogate recoveries.
5. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
6. Samples were analysed on an 'as received' basis. 7. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Acknowledgment.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

UNITS

mg/kg: milligrams per Kilogram

ug/l: micrograms per litre

ppb: Parts per billion

org/100ml: Organisms per 100 millilitres

MPN/100mL: Most Probable Number of organisms per 100 millilitres

mg/l: milligrams per litre

ppm: Parts per million

%: Percentage

NTU: Units

TERMS

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery
CRM	Certified Reference Material - reported as percent recovery
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands. In the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
Batch Duplicate	A second piece of analysis from a sample outside of the clients batch of samples but run within the laboratory batch of analysis.
Batch SPIKE	Spike recovery reported on a sample from outside of the clients batch of samples but run within the laboratory batch of analysis.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
ASLP	Australian Standard Leaching Procedure (AS4439.3)
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within
TEQ	Toxic Equivalency Quotient

QC - ACCEPTANCE CRITERIA

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries : Recoveries must lie between 50-150% - Phenols 20-130%.

QC DATA GENERAL COMMENTS

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxophene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxophene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Arochlor 1260 in Matrix Spikes and LCS's.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPD's are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Organic samples had Teflon liners	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

Sample information

- ☑ A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- ☑ Sample Temperature of a random sample selected from the batch as recorded by Eurofins | mgt Sample Receipt : 12.5 degrees Celsius.
- ☑ All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- ☑ Attempt to chill was evident.
- ☑ Appropriately preserved sample containers have been used.
- ☑ All samples were received in good condition.
- ☑ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- ☑ Organic samples had Teflon liners.
- ☑ Sample containers for volatile analysis received with zero headspace.
- ☒ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

Contact notes

If you have any questions with respect to these samples please contact:

Jean Heng on Phone : (+61) (2) 9900 8400 or by e.mail: JeanHeng@eurofins.com.au

Results will be delivered electronically via e.mail to Kasey Hills - khills@jbsg.com.au.

Attention: K Henderson, Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**	
No. of samples:	1 Water	
Date samples received / completed instructions received	08/07/2014	/ 08/07/2014

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	15/07/14	/ 11/07/14
Date of Preliminary Report:	Not Issued	

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Method ID	Methodology Summary
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-008	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-055/062	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen.

Report Comments:

Asbestos ID was analysed by Approved Identifier:	Not applicable for this job
Asbestos ID was authorised by Approved Signatory:	Not applicable for this job

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

SAMPLE RECEIPT ADVICE

Client:

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney NSW 2000

ph: 02 8245 0300
Fax: 02 8245 0399

Attention: K Henderson, Tyler Creese

Sample log in details:

Your reference:	**43376, Box Hill**
Envirolab Reference:	**112771**
Date received:	08/07/2014
Date results expected to be reported:	**15/07/14**

Samples received in appropriate condition for analysis:	YES
No. of samples provided	1 Water
Turnaround time requested:	Standard
Temperature on receipt (°C)	13.5
Cooling Method:	Ice Pack
Sampling Date Provided:	YES

Comments:

If there is sufficient sample after testing, samples will be held for the following time frames from date of receipt of samples:
Water samples - 1 month
Soil and other solid samples - 2 months
Samples collected in canisters - 1 week. Canisters will then be cleaned.
All other samples are not retained after analysis
If you require samples to be retained for longer periods then retention fees will apply as per our pricelist.

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: K Henderson, Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**		
No. of samples:	2 soils		
Date samples received / completed instructions received	18/06/14	/	18/06/14

Analysis Details:

Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	25/06/14	/	25/06/14
Date of Preliminary Report:	Not Issued		

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.

QUALITY CONTROL Asbestos ID - soils NEPM*	UNITS	PQL	METHOD	Blank
Date analysed	-			[NT]

Report Comments:

Asbestos-ID in soil NEPM;
This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Asbestos ID was analysed by Approved Identifier:	Paul Ching
Asbestos ID was authorised by Approved Signatory:	Paul Ching

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

SAMPLE RECEIPT ADVICE

Client:

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney NSW 2000

ph: 02 8245 0300
Fax: 02 8245 0399

Attention: K Henderson, Tyler Creese

Sample log in details:

Your reference:	**43376, Box Hill**
Envirolab Reference:	**111738**
Date received:	18/06/14
Date results expected to be reported:	**25/06/14**

Samples received in appropriate condition for analysis:	YES
No. of samples provided	2 soils
Turnaround time requested:	Standard
Temperature on receipt (°C)	11.0
Cooling Method:	Ice Pack
Sampling Date Provided:	YES

Comments:

If there is sufficient sample after testing, samples will be held for the following time frames from date of receipt of samples:
Water samples - 1 month
Soil and other solid samples - 2 months
Samples collected in canisters - 1 week. Canisters will then be cleaned.
All other samples are not retained after analysis
If you require samples to be retained for longer periods then retention fees will apply as per our pricelist.

CERTIFICATE OF ANALYSIS 111910

Client:
JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: K Henderson, Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**	
No. of samples:	2 soils	
Date samples received / completed instructions received	20/06/14	/ 20/06/14

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	27/06/14	/ 27/06/14
Date of Preliminary Report:	Not Issued	

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Results Approved By:

Jacinta Hurst
Laboratory Manager

Asbestos ID - soils NEPM* Our Reference: Your Reference Date Sampled Type of sample	UNITS ------------- ------------	111910-1 QC03/A 19/06/2014 soil
Date analysed	-	26/06/2014
Sample mass tested	g	718.0g
Sample Description	-	Brown fine-grained soil & rocks
Asbestos ID in soil	-	No asbestos detected at reporting limit 0.1g/kg
Trace Analysis	-	No respirable fibres detected
ACM>7mm*	-	None
ACM<7mm*	-	None
Fibrous Asb(FA)/Asb Fines(AF)	-	None
Asbestos ww%* Note	-	<0.001
Comments	-	See back page

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.

QUALITY CONTROL Asbestos ID - soils NEPM*	UNITS	PQL	METHOD	Blank
Date analysed	-			[NT]

Report Comments:

This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Asbestos ID was analysed by Approved Identifier:	Matt Mansfield
Asbestos ID was authorised by Approved Signatory:	Paul Ching

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

SAMPLE RECEIPT ADVICE

Client:

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney NSW 2000

ph: 02 8245 0300
Fax: 02 8245 0399

Attention: K Henderson, Tyler Creese

Sample log in details:

Your reference:	**43376, Box Hill**
Envirolab Reference:	**111910**
Date received:	20/06/14
Date results expected to be reported:	**27/06/14**

Samples received in appropriate condition for analysis:	YES
No. of samples provided	2 soils
Turnaround time requested:	Standard
Temperature on receipt (°C)	16.4
Cooling Method:	Ice Pack
Sampling Date Provided:	YES

Comments:

If there is sufficient sample after testing, samples will be held for the following time frames from date of receipt of samples:
Water samples - 1 month
Soil and other solid samples - 2 months
Samples collected in canisters - 1 week. Canisters will then be cleaned.
All other samples are not retained after analysis
If you require samples to be retained for longer periods then retention fees will apply as per our pricelist.

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.

QUALITY CONTROL Asbestos ID - soils NEPM*	UNITS	PQL	METHOD	Blank
Date analysed	-			[NT]

Report Comments:

Asbestos-ID in soil: NEPM
This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Sample 112111-4
Note: All samples analysed as received. However, samples are below the minimum 500mL sample volume as per the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013.

Asbestos ID was analysed by Approved Identifier:	Paul Ching
Asbestos ID was authorised by Approved Signatory:	Paul Ching

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

CERTIFICATE OF ANALYSIS 112508

Client:
JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: TC, KH

Sample log in details:

Your Reference:	**43375, Box Hill**	
No. of samples:	7 Soils	
Date samples received / completed instructions received	01/07/2014	/ 03/07/2014

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	10/07/14	/ 10/07/14
Date of Preliminary Report:	Not Issued	

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.

Date analysed	-			[NT]

Report Comments:

Asbestos-ID in soil; NEPM
This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Asbestos ID was analysed by Approved Identifier: Paul Ching
Asbestos ID was authorised by Approved Signatory: Lulu Guo

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

SAMPLE RECEIPT ADVICE

Client:

JBS & G (NSW & WA) Pty Ltd	ph: 02 8245 0300
Level 1, 50 Margaret St	Fax: 02 8245 0399
Sydney NSW 2000	

Attention: TC, KH

Sample log in details:

Your reference:	**43375, Box Hill**
Envirolab Reference:	**112508**
Date received:	01/07/2014
Date results expected to be reported:	**10/07/14**

Samples received in appropriate condition for analysis:	YES
No. of samples provided	7 Soils
Turnaround time requested:	Standard
Temperature on receipt (°C)	7.8
Cooling Method:	Ice Pack
Sampling Date Provided:	YES

Comments:

If there is sufficient sample after testing, samples will be held for the following time frames from date of receipt of samples:
Water samples - 1 month
Soil and other solid samples - 2 months
Samples collected in canisters - 1 week. Canisters will then be cleaned.
All other samples are not retained after analysis
If you require samples to be retained for longer periods then retention fees will apply as per our pricelist.

CERTIFICATE OF ANALYSIS 112602

Client:

JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**		
No. of samples:	3 Soils		
Date samples received / completed instructions received	04/07/2014	/	04/07/2014

Analysis Details:

Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	15/07/14	/	16/07/14
Date of Preliminary Report:	Not Issued		

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Method ID	Methodology Summary
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-008	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
Ext-054	Analysed by MPL Envirolab

Report Comments:

This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Herbicides in soil analysed by MPL Laboratories. Report No.152851.

Asbestos ID was analysed by Approved Identifier: Paul Ching
Asbestos ID was authorised by Approved Signatory: Paul Ching

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

CERTIFICATE OF ANALYSIS **112770**

Client:
JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: K Henderson, Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**		
No. of samples:	3 Soils		
Date samples received / completed instructions received	08/07/2014	/	08/07/2014

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	15/07/14	/	11/07/14
Date of Preliminary Report:	Not Issued		

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Results Approved By:

Jacinta Hurst
Laboratory Manager

Method ID	Methodology Summary
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-012 subset	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Inorg-008	Moisture content determined by heating at 105+/-5 deg C for a minimum of 12 hours.
ASB-007	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit between 0.01g/kg (0.001% w/w) to 0.1g/kg (0.01% w/w). This form of analysis is outside the scope of NATA accreditation. Note: The screening level of 0.001% w/w asbestos in soil for FA and AF (i.e. non-bonded/friable asbestos) only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres.

Report Comments:

This report is consistent with the analytical procedures and reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

Asbestos ID was analysed by Approved Identifier:	Paul Ching
Asbestos ID was authorised by Approved Signatory:	Paul Ching

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Attention: K Henderson, Tyler Creese

Sample log in details:

Your reference:	**43376, Box Hill**
Envirolab Reference:	**112770**
Date received:	08/07/2014
Date results expected to be reported:	**15/07/14**

Samples received in appropriate condition for analysis:	YES
No. of samples provided	3 Soils
Turnaround time requested:	Standard
Temperature on receipt (°C)	13.5
Cooling Method:	Ice Pack
Sampling Date Provided:	YES

Comments:

If there is sufficient sample after testing, samples will be held for the following time frames from date of receipt of samples:
Water samples - 1 month
Soil and other solid samples - 2 months
Samples collected in canisters - 1 week. Canisters will then be cleaned.
All other samples are not retained after analysis
If you require samples to be retained for longer periods then retention fees will apply as per our pricelist.

CERTIFICATE OF ANALYSIS **112771**

Client:
JBS & G (NSW & WA) Pty Ltd
Level 1, 50 Margaret St
Sydney
NSW 2000

Attention: K Henderson, Tyler Creese

Sample log in details:

Your Reference:	**43376, Box Hill**		
No. of samples:	1 Water		
Date samples received / completed instructions received	08/07/2014	/	08/07/2014

Analysis Details:
Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.
Please refer to the last page of this report for any comments relating to the results.

Report Details:

Date results requested by: / Issue Date:	15/07/14	/	11/07/14
Date of Preliminary Report:	Not Issued		

NATA accreditation number 2901. This document shall not be reproduced except in full.
Accredited for compliance with ISO/IEC 17025. **Tests not covered by NATA are denoted with *.**

Results Approved By:

Jacinta Hurst
Laboratory Manager

Method ID	Methodology Summary
Org-013	Water samples are analysed directly by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-005	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Org-008	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC with dual ECD's.
Metals-022 ICP-MS	Determination of various metals by ICP-MS.
Metals-021 CV-AAS	Determination of Mercury by Cold Vapour AAS.
Metals-020 ICP-AES	Determination of various metals by ICP-AES.
Inorg-055/062	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen.

Report Comments:

Asbestos ID was analysed by Approved Identifier:	Not applicable for this job
Asbestos ID was authorised by Approved Signatory:	Not applicable for this job

INS: Insufficient sample for this test	PQL: Practical Quantitation Limit	NT: Not tested
NA: Test not required	RPD: Relative Percent Difference	NA: Test not required
<: Less than	>: Greater than	LCS: Laboratory Control Sample

Quality Control Definitions

Blank: This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.

Duplicate: This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.

Matrix Spike : A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.

LCS (Laboratory Control Sample) : This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.

Surrogate Spike: Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.
Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.
Spikes for Physical and Aggregate Tests are not applicable.
For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: <5xPQL - any RPD is acceptable; >5xPQL - 0-50% RPD is acceptable.
Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals; 60-140% for organics and 10-140% for SVOC and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Well No: MW05

Project No: 43376
Client: APP Corporation
Project Name: 43376 Box Hill North DSI+RAP
Site Address: Box Hill, NSW

Date: 27/06/14
Contractor: Rockwell Drilling Services
Drill Rig: Geoprobe
Method: Solid Flight Auger, Hammer
Total Hole Depth (mbgs): 2.5

Eastings (MGA): -
Northings (MGA): -
Reference Level: -
Elevation: Surface (m) - **TOC (m):** -
Bore Diameter (mm): 100

Water Level Initial (mbgs): -
Water Level Static (mbgs): -
Casing Type/Surface Finish: Roadbox
Screen Diameter (mm): 75 **Screen Length (m):** 1.5
Casing Diameter (mm): 75 **Casing Length (m):** 1.0

SUBSURFACE PROFILE			SAMPLE				
Depth (m)	**Graphic Log**	**Lithologic Description**	**Sample ID**	**PID (ppm)**	**Sample Type**	**Comments**	**Well Construction**
		Ground Surface					RB
0.0		**Silty CLAY (CL)** Silty CLAY, red-brown, heterogeneous, firm, medium plasticity, dry.				No odours, stains or ACM observed.	
1.0							
		Weathered SHALE (SH) Weathered SHALE (SH), red-brown, heterogeneous, dry.				No odours, stains or ACM observed.	
2.0							
		Weathered SHALE (SH) As above, damp.				No odours, stains or ACM observed.	
		End of Hole at 2.5 m bgs Refusal on shale.

Field Equipment Calibration and Decontamination

JBS&G

PROJECT NAME: Box Hill	**PROJECT NO:** 43376
FIELD DATES: 17/6/14	**FIELD STAFF:** T.C, ER

CALIBRATION SUMMARY
EQUIPMENT: PID
CALIBRATION STANDARD: Zero / iso

DATE	TIME	READING (ppm$_v$)	COMMENTS
17/6/14	7:30am	0.0	Zeroed (carbon) + calibrated (isobutylene)

DECONTAMINATION SUMMARY

EQUIPMENT: Hand auger + shovel

	Y	N	NA
1. Was the equipment decontaminated appropriately prior to sampling at each location?	Y	N	NA
2. Was excess soil removed by scraping, brushing or wiping with disposable towels?	Y	N	NA
3. Was the equipment contaminated with grease, tar or similar material? If so, was the equipment steam cleaned or rinsed with pesticide-grade acetone:hexane?	Y Y	N N	NA
4. Was phosphate-free detergent used to wash the equipment?	Y	N	NA
5. Was the equipment rinsed with clean water?	Y	N	NA
6. Was the equipment then rinsed with deionised water?	Y	N	NA
7. Were all sample containers cleaned and acid or solvent washed prior to sample collection?	Y	N	NA

WERE ANY ADDITIONAL DECONTAMINATION MEASURES REQUIRED? PROVIDE DETAILS.

New gloves used for each sample.

OEH – NSW Office of Environment and Heritage

OCPs – Organochlorine Pesticides

OPPs – Organophosphate Pesticides

PAHs – Polycyclic Aromatic Hydrocarbons

PCBs – Polychlorinated Biphenyls

RAP – Remedial Action Plan

SEPP – State Environment Protection Policy

TRH – Total Recoverable Hydrocarbons

UST - Underground Storage Tank

WHS – Work Health and Safety

Executive Summary

JBS&G Australia Pty Ltd (JBS&G) was engaged by E.J. Cooper and Son Pty Ltd (EJC, the client) c/- APP Corporation Pty Ltd (APP) to prepare a Remedial Action Plan (RAP) at land at Box Hill North, NSW (the site). The site occupies part of the land bound by Boundary Road to the west, Old Pitt Town Road to the south, Maguires Road to the north, and Janpieter Road to the east, and has an area of approximately 380 hectares. The site location is show in **Figure 1**.

It is understood that the site is proposed to be subdivided and developed comprising residential properties, commercial and retail, school and open space land uses. The site will be developed in a staged approach, with the site having been separated into nine separate Precincts (Precincts A-I).

In July 2013, JBS&G prepared the Draft Preliminary Site Investigation (PSI) report for the site (JBS 2013[1]).

Based on the results of the investigation, it was concluded that there was potential for surface and subsurface contamination to be present resulting from current and previous site use (agricultural use). The PSI identified a number of Areas/Activities of Environmental Concern (AECs) across the site.

Consequently, a DSI was completed by JBS&G (JB&G 2014[2]) which identified heavy metal, hydrocarbon and asbestos impacts to the soils at the site. Additionally, aesthetic impacts associated with asbestos and building rubble were identified at the site. Concentrations of contaminants of potential concern (COPCs) were not reported within the groundwater samples collected and analysed at the site. It was recommended that a RAP be prepared to address the identified impacts to render the site suitable for its proposed land uses.

Consequently, this RAP has been developed to address the identified impacts at the site to render the site suitable for the proposed land uses.

The objectives of the RAP are to:

- Summarise the Site characteristics;
- Define the extent of remediation required;
- Assess appropriate remediation options and select a preferred option;
- Document the remediation methodology, including the associated safety and environmental management controls;
- Establish pre-determined validation criteria relevant to the likely future land use and detail the validation program (including reporting);
- Identify the regulatory requirements relevant to the proposed remedial works; and
- Outline any potential ongoing monitoring or management requirements to ensure the continued protection of human health and the environment.

The preferred remedial option is to excavate impacted fill materials for potential onsite containment with management under an Environmental Management Plan (EMP) with excess material removed for offsite disposal. Offsite disposal of material may be required to suit the staged development to occur.

With the development to occur over the next ten years within the Precincts, the preferred remedial strategy can be applied across the site as a whole, or on a staged basis.

[1] Draft Preliminary Site Investigation, Box Hill North, NSW, JBS Environmental Pty Ltd (now JBS&G), July 2013 (JBS 2013).
[2] Detailed Site Investigation, Box Hill North, NSW, JBS&G, August 2014 (JBS&G 2014).

Subject to the successful implementation of the measures detailed in this RAP and subject to the limitations in **Section 15**, it is considered that the identified impacted soils can be remediated and validated without the need for further management.

However, should impacted material be retained at the site that does not meet the adopted land use scenario criteria then an EMP will be required to manage the potential risk to future site users.

1. Introduction

1.1 Introduction and Background

JBS&G Australia Pty Ltd (JBS&G) was engaged by E.J. Cooper and Son Pty Ltd (EJC, the client) c/- APP Corporation Pty Ltd (APP) to prepare a Remedial Action Plan (RAP) at land at Box Hill North, NSW (the site). The site occupies part of the land bound by Boundary Road to the west, Old Pitt Town Road to the south, Maguires Road to the north, and Janpieter Road to the east, and has an area of approximately 380 hectares. The site location is show in **Figure 1**.

The site is proposed to be subdivided and developed comprising residential properties, commercial and retail, school and open space land uses. The site will be developed in a staged approach, with the site having been separated into nine separate Precincts (Precincts A-I), with the development within each Precinct also completed in a staged approach that is yet to be finalised.

In July 2013, JBS&G prepared the Draft Preliminary Site Investigation (PSI) report for the site (JBS 2013[3]).

Based on the results of the investigation, it was concluded that there was potential for subsurface contamination to be present resulting from current and previous site use (agricultural use). The PSI identified a number of Areas/Activities of Environmental Concern (AECs) across the site.

It was considered unlikely that the AECs identified would have impacted the land to a degree that would prevent planning and development of the land for the intended use(s). It was recommended that a detailed site investigation (DSI) be completed to assess the extent of contamination prior to future development.

Consequently, a DSI was completed by JBS&G (JB&G 2014[4]) which identified heavy metal, hydrocarbon and asbestos impacts within the soils are the site. Additionally, aesthetic impacts associated with asbestos and building rubble were identified at the site. Concentrations of contaminants of potential concern (COPCs) were not reported within the groundwater samples collected and analysed at the site. It was recommended that a RAP be prepared to address the identified impacts to render the site suitable for its proposed land uses.

Consequently, it was recommended that a RAP be developed to address the identified impacts at the site to render the site suitable for the proposed land uses.

It is understood that the remediation and validation is to be undertaken during the construction phases of each Precinct development. Consequently the RAP has been developed to be flexible and enable adjustment of approach to suit the staged development and changing requirements as development progress.

Review of both the RAP and future Validation reports is to be completed by a NSW EPA accredited Site Auditor.

The RAP has been developed in accordance with guidelines made and endorsed by the NSW EPA.

[3] Draft Preliminary Site Investigation, Box Hill North, NSW, JBS Environmental, Pty Ltd (now JBS&G), July 2013 (JBS 2013).

[4] Detailed Site Investigation, Box Hill North, NSW, JBS&G, August 2014 (JBS&G 2014).

1.2 Objectives

The objectives of the RAP are to:

- Summarise the Site characteristics;
- Define the extent of remediation required;
- Assess appropriate remediation options and select a preferred approach or approaches;
- Document the remediation methodology, including the associated safety and environmental management controls;
- Establish pre-determined validation criteria relevant to the likely future land uses and detail the validation program (including reporting);
- Present contingency options to enable flexibility in approaches to remediation as staged development progresses to remediation, or in the event an alternative approach is required;
- Present unexpected finds protocol to allow management of previously unidentified impacts;
- Identify the regulatory requirements relevant to the proposed remedial works; and
- Outline any potential ongoing monitoring or management requirements to ensure the continued protection of human health and the environment.

2. Site Conditions and Description

2.1 Site Identification

The location of the site is shown on **Figure 1**. Site Details are summarised in **Tables 2.1** and **2.2** and on **Figure 2**, and are described in more detail in the following sections. Precinct layouts are shown in **Figures 3** and **4**.

Table 2.1: General Site Information

Local Government Authority	The Hills Shire (formerly Baulkham Hills Shire)
Approximate co-ordinates (MGA 56) of the centre of the site	E: 305908.887, N: 6277394.06
Current Use	Rural Residential, Agricultural. Current ownership as per **Table 2.2**
Previous Use	Rural Residential, Agricultural, open space/vacant
Total Site Area	Approx. 380 ha (based on information provided by APP).
Proposed Use	Residential, Commercial/Industrial and Open Space, Recreational
Zoning	Zoning as per **Table 2.2.**

The site was inspected during the previous investigation undertaken (JBS&G 2013).

The site is located approximately 42 km northwest of Sydney's CBD within a predominantly rural residential/agricultural area. The site is comprised of 31 lots and are summarised in **Table 2.2**.

The lots investigated as part of the previous investigation (JBS&G 2014) along with the Precincts are shown on **Figure 4.**

2.2 Site Description

A detailed inspection of accessible areas of the site was conducted between 20 and 24 May 2013 as part of the PSI (JBS 2013).

The site was comprised of predominantly rural residential/agricultural land which had been subdivided into 31 separate lots of between 10 and 12.7 ha.

The majority of the site lots contained rural residences and agriculturally-related outbuildings including workshops, with agricultural fields and uncleared woodlot. The agricultural fields consisted primarily of grazing land (cattle, horse stables) and land for growing crops (market gardens). Numerous farm dams and associated creeks were also located throughout the site. An electrical transmission corridor, oriented northeast-southwest, transected the northwest portion of the site.

2.3 Surrounding Land use

The current land uses of adjacent properties or properties across adjacent roads are summarised below:

- North - Maguires Road with rural residential, vacant/agricultural land, and bushland beyond.
- East – Janpieter Road and/or rural residential and vacant/agricultural land.
- South – Old Pitt Town Road and/or rural residential and vacant/agricultural land.
- West – Boundary Road and/or rural residential and vacant/agricultural land, and Sheyville National Park approximately 0.5 km further west.

2.4 Topography

Review of the regional topographic data outlined in the previous assessment (JBS&G 2014) indicated the site lies at approximately 40 m Australian Height Datum (AHD), with an overall gradient sloping gently to the west. The general topography of the site is relatively flat to gently rolling. Numerous small creeks cross the site, connecting farm dams, with the main creek, Cataract Creek, and oriented north-south at Lot 4 DP135304A&B at the north portion of the site.

2.5 Geology

Review of the previous assessment (JBS&G 2014) indicated the site is underlain by Middle Triassic Bringelly Shale, Mittagong Formation and Ashfield Shale, all part of the Wianamatta Group. The Bringelly Shale consists of shale, carbonaceous claystone, claystone, laminite, fine to medium-grained lithic sandstone, rare coal and tuff. The Mittagong Formation consists of fine to medium-grained quartz-lithic sandstone. The Ashfield Shale consists of dark-grey to black claystone-siltstone and fine sandstone-siltstone laminite.

The site is located within two soil landscape groups, the residual Lucas Heights and Blacktown Soil Landscapes.

The Lucas Heights Landscape soils are typically found on gently undulating crests and ridges on plateau surfaces of the Mittagong Formation, with local reliefs of up to 30 m and shallow slopes. The soils generally consist of moderately deep hard setting yellow podzolic and yellow soloth soils. The profile is characterised by stony soil, low soil fertility and low available water capacity.

The Blacktown Soil Landscape soils are typically found on gently undulating rises overlying shales of the Wianamatta Group, with local reliefs of up to 30 m and shallow slopes. The soils generally consist of shallow to moderately deep hard setting podzolic soils, typically mottled red and brown on crests and grading to yellow on lower slopes and within drainage lines. The profile is characterised by moderately reactive highly plastic subsoils, low soil fertility and poor soil drainage.

The intrusive investigation completed recently for the various lots indicates that the majority of the site is underlain by a silty clay and shale from near the surface.

2.6 Hydrology

The site lies approximately 7 km southeast of the Hawkesbury River, and Cataract Creek (a tributary to the Hawkesbury River) lies approximately 0.5 km northeast of the site. The site is predominantly unsealed, and as such the majority of precipitation falling on the site is expected to infiltrate to the underlying soils and/or be collected by numerous small creeks which flow to existing on-site farm dams. In addition, surface runoff across the site area is expected to flow to Cataract Creek, likely via an unnamed creek (oriented north-south) at Lot 4 DP135304A&B in the northern portion of the site.

2.7 Hydrogeology

Based on the previous investigation (JBS&G 2014) completed, groundwater was anticipated to flow to the northwest towards the Hawkesbury River and/or to Cataract Creek (a tributary of the Hawkesbury River).

A total of five groundwater monitoring wells (MW1-MW5) were installed at the site, with measured depth to groundwater ranging from 2.8 m below top of casing (btoc) to 7.4 (btoc).

It should be noted that two of the monitoring wells (MW3 and MW5) were dry.

2.8 Acid Sulfate Soils

Review of the previous investigation (JBS&G 2014) indicates that there is no High or Low probability of occurrence of acid sulfate soils within the soil profile located on the site. Additionally, no evidence of acid sulfate soils were reported during the previous investigation (JBS&G 2014).

2.9 Proposed Development

The site is planned to be subdivided and developed into the following land uses:

- Approximately 290 hectares of residential land, comprising 4100 lots, including high and low density housing;
- A 5.5 hectare town centre incorporating a mix of retail, commercial and business uses;
- A 2.2 hectare school site;
- Over 77 hectares of active and passive open space; and
- New roads and infrastructure.

The development plans are provided in **Appendix A** and **Figure 3** shows the proposed future land uses. It is understood that the development stages will be completed from A through to I.

As discussed in **Section 2.2** the site have been divided into nine Precincts for the future development works.

It should be noted that there are six lots that are included in the Precinct development plans but have not been investigated due to access restrictions. These include the following:

- Lot 1 DP782360 on Boundary Road in the northwest (adjoining lot reference #3, **Figure 2**);
- The lot between Lot 23 DP255616 and Lot 25 DP255616 (on Red Gables Road);

- The lot between Lot 27 DP255616 and Lots 29 and 30 DP 255616 (on Red Gables Road);
- The lots east of Lot 43 DP255616 (access via Janpieter Road);
- The lot west of Lot 2 DP253552 (on Old Pitt Town Road); and
- The lot between Lot 2 DP253552 and Lot 4 DP253552 (on Old Pitt Town Road).

The lots and the Precincts are summarised in **Table 2.3**, and the lots not investigated are summarised in **Table 2.4** following:

Table 2.3 Summary of Precincts

Precincts	Map Reference for Lots
Precinct A	24, 25, 26, 27
Precinct B	18, 19, 20, 23
Precinct C	21, 22, 28, 29
Precinct D	8, 9, 10, 11
Precinct E	12, 13, 14
Precinct F	15, 16, 17

Table 2.4 Summary of Lots not Investigated

Lot Location Description and Precinct	Map Reference for Lots
Lot 1 DP782360 on Boundary Road (Precinct D)	West of Map Reference #3 (**Figure 2**)
Lot 24 DP255616 between Lot 23 DP255616 and Lot 25 DP255616 (on Red Gables Road) (Precinct E)	Located between Map References #11 and #12 (**Figure 2**)
Lot 28 DP255616 between Lot 27 DP255616 and Lots 29 and 30 DP 255616 (on Red Gables Road) (Precinct E)	Located between Map References #14 and #16/#17 (**Figure 2**)
Lots 421-425 DP1183810 east of Lot 43 DP255616 (access via Janpieter Road) (Precinct C)	Located east of Map Reference #22 (**Figure 2**)
Lot 1 DP253552 west of Lot 2 DP253552 (on Old Pitt Town Road) (Precinct H)	Located between Map References #26/#27 and #30 (**Figure 2**)
Lot 3 DP253552 between Lot 2 DP253552 and Lot 4 DP253552 (Precinct H)	Located between Map References #30 and #31 (**Figure 2**)

Refer to **Figure 4** for Precinct land uses and lots.

3. Summary Site History

3.1 Site History

Based on the historical information provided in the previous investigation (JBS&G 2013) report, the history of the site is summarised in **Table 3.1** below

Table 3.1 Summary of Site History

Period	Activity	Source
1900s to 1940s	Portions of the site are owned by an orchardist and farmers (including dairy farmers). In the 1947 aerial photograph the site is mostly open grassed agricultural land with some limited rural residential farmhouses at the northern portion of the site off of Maguires Road. Medium density woodland/scrubland also located at the northern portion of the site.	Titles and 1947 aerial photograph
1940s-1970s	Site remains mostly as open grassed agricultural land, with increasing number of farm dams at scattered locations across the site. Woodland cover at the northern portion of the site gradually decreases. The south eastern portion of the site may have been used for horse training purposes. In1978 Red Gables Road and Cataract Road appear to be under construction, and additional rural residential buildings at the northern portion of the site (between Red Gables Road and Maguires Road).	Titles and 1955, 1961, 1970 and 1978 aerial photographs
1979-1980	The site has been subdivided into its current layout, with site use predominantly remaining agricultural (market gardens).	Titles
1980s - present	The subdivision of the site as referenced for 1979-1980 is apparent (as observed in the 1986 aerial photograph) with rural residential buildings at the majority of the subdivided lots at the approximate centre and southern areas of the site (between Red Gables Road and Old Pitt Town Road, east of Cataract Road). Site use (agricultural, rural residential) appears consistent between 1980s and present.	1986, 1994 and 2005 aerial photographs, site inspection (May 2013).

3.2 Previous Investigations

3.2.1 JBS, PSI 2013

JBS was engaged by APP to conduct a PSI at land at Box Hill North, NSW.

The objectives of the investigation were to assess the potential for widespread contamination based on the current and historical site activities and to draw preliminary conclusions of the potential contamination status of the site, with the consideration of potential development of the site for residential use.

The scope of work comprised:

- Review of topography, geology and hydrogeology of the site and surrounding areas;
- Review of available Council documentation, aerial photos, legal title information, EPA records and Heritage records to identify areas of environmental concern and associated COPCs;
- Conducting a detailed inspection of 31 properties comprising the site; and
- Preparation of a PSI report.

The site investigation identified the following issues at the site:

- Areas in which asbestos fragments and asbestos containing material (ACM) piping were observed on and embedded in the ground surface, and buildings containing ACM were identified;
- Potential lead paint associated with current/historic buildings;

- Current/former workshop areas in which oil staining was observed, and at areas where petroleum products/diesel fuel were stored;
- Areas of surface debris, drums, burn pits and debris stockpiles;
- Areas where former orchards/tree nurseries were identified; and
- Areas where disturbed terrain/stockpiles and/or imported fill were observed.

Based on the results of the investigation, it was concluded that there was potential for subsurface contamination to be present resulting from current and previous site use (agricultural use). Based on the site observations and agriculturally-related site activities, it was considered that the potential for widespread contamination across the site was low, with the possible exception of asbestos.

Due to site observations at some site lots (such as large maintenance sheds, petrol/diesel and chemical storage), observations of potential commercial activities at some site lots, and limited access to some buildings and lot areas, there had been and currently was storage of Dangerous Goods at the site.

It was considered unlikely that the AECs identified would have impacted the land to a degree that would prevent planning and development of the land for the intended use(s). It was recommended that a Detailed Site Investigation (DSI) be completed to assess the extent of contamination prior to future development.

It was also recommended that, based on the age of the structures as identified on-site, and the presence of suspected ACM, a hazardous materials building inspection be conducted for all structures located on the site to enable appropriate management during future development.

3.2.2 JBS&G, DSI 2014

JBS&G Australia Pty Ltd (JBS&G) was engaged by E.J. Cooper and Son Pty Ltd (EJC, the client) c/- APP Corporation Pty Ltd (APP) to conduct DSI at the site. The previous sample locations are shown on **Figures 5a** to **5e and Figure 6**.

The scope of works completed for this assessment comprised:

- Review and summary of relevant background information;
- A detailed inspection of the site;
- Soil sampling within 31 lots within the site boundary;
- Installation and groundwater sampling from five groundwater monitoring wells;
- Analysis of selected soil and groundwater samples for various COPCs;
- A detailed site inspection for hazardous building materials and preparation of a hazardous materials assessment report; and
- Assessment and preparation of a DSI report in general accordance with guidelines made or approved by the NSW EPA.

Based on the findings of the DSI, the following conclusions were made with respect to the site:

- Fill material was encountered from the ground surface at all sampling locations and generally comprised silty clay.
- Concentrations of arsenic, chromium and/or lead were reported in some soil samples exceeding the adopted health criterion in five separate lots.

- Concentrations of carcinogenic polycyclic aromatic hydrocarbons (PAHs) (including B(a)P) were reported to exceed the adopted health criterion in one soil sample collected from one lot.
- A total of eight soil samples exceeded the ecological criterion for TRH fractions, with these located in four lots.
- A total of five soil samples exceeded the Management Limits for TRH fractions, with these located within two lots.
- Non-friable ACM was observed across the site in 11 different locations within five lots. It should be noted that lots with heavy vegetation may obscure the occurrence of additional potential ACM fragment impacts. These pose a potential future risk to site users and if weathered could pose a potential migration risk from the site. Free asbestos (FA) fibres or asbestos fines (AF) were also reported in seven soil samples analysed from four lots.
- Aesthetic impacts have been identified including ACM on ground surfaces and in surface soils (as noted above), friable asbestos in soil, as well as minor isolated surface staining and odorous soils. These areas will require management as part of future development works at the site.
- Groundwater monitoring wells were installed at five locations across the site, with three being sampled. Two of the groundwater monitoring wells were found to be dry.
- Concentrations of COPCs were either not detected or below adopted investigation levels within the groundwater samples collected, which indicates that identified soil impacts are not impacting groundwater.
- The ASTs currently present at the site require management to prevent further impacts to the site.
- A total of 20 stockpiles were reported across the site.
- The DSI did not identify any widespread or gross soil contamination, with potentially unacceptable risks from soil contamination typically localised, limited in extent, and able to be readily managed to enable all proposed land uses at the site.

The DSI recommended that a RAP be prepared to address the identified impacts to render the site suitable for its intended uses.

4. Data Gaps

4.1 Background

Based on the previous investigations (JBS 2013 & JBS&G 2014) completed there are several areas that have been identified within the Precincts that require further assessment.

There are six lots that are included in the development proposal for the new Precincts but no assessment has been completed due to access restrictions (refer **Section 2.9** and **Table 2.4**).

A hydroponic installation located in the western portion of the site was not assessed during the previous investigations due to access restrictions.

Additionally, numerous farm dams have been identified at the site, once drained these dams will require assessment.

Based on results and observations made during the previous assessment (JBS&G 2014) further investigation is warranted in several lots to assist in the delineation of identified impacts prior to remediation and validation.

4.2 Data Gaps

Based on the information provided in **Section 4.1**, there exists data gaps at the site. These include the following:

- Six lots not previously investigated;
- Former farm dams, with one dam reporting ACM present;
- Hydroponic Installation;
- Assessment of footprints of buildings to be demolished;
- Assessment of a single AST located within Lot 31; and
- Delineation of impacts within several lots prior to remediation.

Based on the above, the following sections outline the assessment of these data gap areas.

4.2.1 Site Inspection

An initial site inspection of each future Precinct should be completed prior to construction works beginning due to potential changes to the site subsequent to this RAP being prepared. The confirmatory inspections will take place to ensure the following:

- Presence of known stockpiles;
- Presence of known ASTs;
- Presence of known ACM impacted areas;
- Identification of any illegal dumping, further weathering of identified ACM sheeting; and
- Identification of any unexpected finds.

The current site conditions are provided in **Table 5.1**.

4.2.2 Six Lots Not Previously Investigated

As discussed in **Section 2.9**, a total of six current lots are included in the Precinct development that have not been assessed due to access restrictions (refer **Table 2.4**). These lots include:

- Lot 1 DP782360 on Boundary Road in the northwest (adjoining lot reference #3, **Figure 2**);

- The lot between Lot 23 DP255616 and Lot 25 DP255616 (on Red Gables Road);
- The lot between Lot 27 DP255616 and Lots 29 and 30 DP 255616 (on Red Gables Road);
- The lots east of Lot 43 DP255616 (access via Janpieter Road);
- The lot west of Lot 2 DP253552 (on Old Pitt Town Road); and
- The lot between Lot 2 DP253552 and Lot 4 DP253552 (on Old Pitt Town Road).

Prior to development of the Precincts in which these lots are situated (**Figure 4**, hashed) will require assessment by an environment consultant. The assessment will involve a Phase 1 Environmental Site Assessment, detailing the history of the lot and preparation of a conceptual site model to assess the potential contamination present. The Phase 1 will require Auditor review and will detail whether further assessment is warranted.

During the development phase of works these lots will require assessment for potential environmental impacts. For each site, the Contaminated Sites: Sampling Design Guidelines (EPA 1995) has been reviewed to provide a recommended number of sampling locations. Where sites are above 5 Ha, the sampling guidelines do not provide a recommended number of sample locations. Consequently, the number of locations are to be targeted at specific AECs observed at the site. A Sampling Analysis and Quality Plan must be prepared and reviewed by the Site Auditor prior to assessment of each lot (if required).

Soil samples will be collected through either hand tools and/or an excavator.

The number of locations for each lot is provided in **Table 4.1** below:

Table 4.1 Six Lots Investigation

Lot	Approximate Lot Size (Ha unless stated)	Number of locations	Analytes
Lot 1 DP782360, west of Map Reference #3 (**Figure 2**)	2000 m^2	7	8 metals/total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene, xylene (BTEX) PAH, Asbestos
Lot 24 DP255616 between Lot 23 DP255616 and Lot 25 DP255616, located between Map References #11 and #12 (**Figure 2**)	10	2 sample locations per hectare	8 metals/TPH/BTEX PAH, Asbestos
Lot 28 DP255616 between Lot 27 DP255616, Lot 29 and 30 DP 255616, located between Map References #14 and #16/#17 (**Figure 2**)	10	2 sample locations per hectare	8 metals/TPH/BTEX PAH, Asbestos
Lots 421-425 DP1183810 east of Lot 43 DP255616, located east of Map Reference #22 (**Figure 2**)	10	2 sample locations per hectare	8 metals/TPH/BTEX PAH, Asbestos
Lot1 DP253552 west of Lot 2 DP253552, located between Map References #26/#27 and #30 (**Figure 2**)	10	2 sample locations per hectare	8 metals/TPH/BTEX PAH, Asbestos
Lot 3 DP253552 between Lot 2 DP253552 and Lot 4 DP253552, located between Map References #30 and #31 (**Figure 2**)	10	2 sample locations per hectare	8 metals/TPH/BTEX PAH, Asbestos

4.2.3 Farm Dams

Within the sites, there exists farm dams. These will be drained and likely backfilled and areas re-shaped during the development works. After the initial draining but prior to re-shaping of the farm dams, assessment of the walls and bases of the dams is required.

An environmental consultant will complete an inspection of the drained dams and soil samples collected to assess for potential impacts including TPH, heavy metals, OCPs, ammonia and biological impacts, including E.Coli.

Additionally, potential ACM was been reported within the wall of one dam within map reference #9 (**Figure 3**) and consequently further assessment within the walls and base of this farm dam is required. Test Pits will be excavated into the dam wall and base to assess for asbestos impacts.

Test Pits completed within the dam walls must be completed at 1 sample per 50 m within the walls with at least 1 sample per wall being required. For the base of the drained dams, a base sample will be collected at a rate of 1 sample per 2500 m^2.

4.2.4 Hydroponic installation (Map Reference #23)

A hydroponic installation was located in the western portion of the site within map reference #23. This installation was not inspected or investigated during the previous investigations due to access restrictions.

Consequently, an assessment is required. During the construction works, after the installation has been decommissioned, soil samples are required to be collected within the former hydroponic site.

Test pits will be excavated in the former hydroponic installation, with assessment of asbestos and heavy metals required.

The hydroponic installation has been assumed to be approximately 500 m^2 and consequently it is considered appropriate to collect 5 samples, in accordance with the EPA 1995 sample design guidelines. Soil samples collected within the footprint of the installation will be analysed for asbestos, metals, OCPs and herbicides.

4.2.5 ASTs

During the DSI (JBS&G 2014) various ASTs were reported within several of the parcels and consequently there are potential impacts associated with the ASTs, including staining and/or odourous soils.

During the demolition stage of the development the various ASTs identified will be removed and disposed of offsite. During this process an environmental consultant will oversee the removal works to assess for any impacts to the surrounding area.An AST was reported within map reference #31 at the site but was not assessed during the previous investigation due to access restrictions.

Where ASTs have been present at the site, validation sampling will be completed below the base of the former AST regardless of aesthetic observations.

Where stained and/or odourous soil around the ASTs are observed, then further assessment is required to assess potential for leaks. Test pits will be completed using an excavator with samples collected within and below the identified impacts. Further validation will be required for delineation sampling.

Test pit samples will be analysed for heavy metals, TPH/BTEX, volatile organic compounds (VOCs) and PAHs.

Validation samples will be analysed for heavy metals, TPH/BTEX, VOCs and PAHs and will be collected on a frequency of 1 validation sample per 10 m linear of walls and 1 base validation sample per 25 m^2.

4.2.6 Delineation Sampling

Based on the previous investigation (JBS&G 2014), there are several areas which require further assessment to delineate identified impacts. Should further impacts that require remediation be reported during any further assessments then these should be addressed in the subsequent investigation reports and provided to the appointed site auditor for review.

These are summarised in **Table 4.2** below:

Table 4.2 Delineation Assessment

Lot	Location	Description	COPCs	Assessment	Sampling Frequency
1	A – around SS20 location	Structure contained lead paint, surface soils around property require further assessment	Lead	Surface Sampling	Initial sampling 1 m out from each wall of building, then at 5m out
3	A – around TP03 location	ACM on surface and in fill material Additional site inspection for ACM in long grass areas associated with TP04/TP05	ACM	Test Pitting & Inspection	4x test pits 5 m around initial location
6	Orchard	EIL exceedance in orchard requires further assessment	Metals	Surface Sampling	4x test pits 5 m around initial location
7	A – around SS01 location	ACM on surface and inspection of entire lot	ACM	Test Pitting	4x test pits 5 m around initial location. Extended if further asbestos identified.
8	G – around TP03 and TP04 location	ACM observed adjacent to dog kennels and a potentially filled gully	ACM, Aesthetic impacts	Test Pitting	4x test pits 5 m around initial location. Assessment of gully size and further test pitting
19/20	SP-around TP12 & TP05/06 locations	Animal remains	Biological Hazards including E.Coli, f coli and salmonella and heavy metals	Test Pitting	4x test pits 5 m around initial locations of animal remains
27	Dog Kennels	Dog Kennels potentially contain hazardous building materials	ACM, metals, TPH/BTEX	Site Inspection and surface sampling	4x test pits 5 m around initial location of dog kennels.
29	SP location Around TP02	Stockpiles of anthropogenic materials and anthropogenic materials in surface soils	ACM	Stockpile Sampling and test pitting	1 sample per 25 m^3 up to 200 m^3. 4x test pits within initial location to assess material

4.2.7 Footprint of former structures

The development of the Precincts will involve the demolition of all the current buildings at the site. The demolition works are to be completed by be an appropriate demolition contractor with appropriate controls and management plans in place.

Subsequent to the demolition and removal of building materials, assessment within the footprints of the former structures will be required, using hand tools to assess the potential surface impacts from hazardous building materials as well as zinc and nickel due to run-off from building structures. Samples must be collected on a 20 m grid from within the former building footprints for lead asbestos, OCP and PCB analysis. Additionally, samples must be collected from no more than 1 m outside of the former building footprint on a 20 m grid to assess for potential for zinc, nickel, lead paint flakes and ACM fragments.

Additionally, an inspection of the footprint for visible lead paint flakes, staining and ACM fragments must be completed by a suitably qualified environmental consultant.

4.2.8 Stockpile Sampling

The stockpiles and the required remediation that have been identified at the site are provided in **Section 5**. However, should further stockpiles be generated (i.e. illegal dumping) subsequent to this RAP or if waste classification is required then further sampling as per **Table 7.3** will be required.

It should be noted that in certain lots there are more than one stockpile of material. For the purpose of this RAP the visual representation on the figures, reference is given to a single stockpile location. However, more than one stockpile may be present at these locations. Consequently, all stockpile material within each lot must be remediated as per the requirements in this RAP.

5. Remedial Options

5.1 Remediation Objectives

The remediation objectives are outlined as follows:

- Removal of unacceptable risks to human health and the environment from the identified asbestos, hydrocarbon and heavy metal impacted fill material at the site;
- Validate the remedial works in accordance with the relevant NSW EPA Guidelines and with reference to the adopted site criteria; and
- Document the validation process.

The RAP is consistent with the following guidelines and legislation:

- *Contaminated Sites: Guidelines for Consultants Reporting on Contaminated Sites, NSW Office of Environment and Heritage, August 2011* (OEH 2011).
- *Contaminated Sites: Guidelines for NSW Site Auditor Scheme, April 2006* (DEC 2006).
- *National Environment Protection (Assessment of Site Contamination) Measure, National Environment Protection Council, 2013* (NEPC 2013).
- *Managing Land Contamination, Planning Guidelines, SEPP 55 – Remediation of Land;* (DUAP 1998).
- *Code of Practice for the Safe Removal of Asbestos, 2nd Edition, National Occupational Health and Safety Commission, April 2005* (NOHSC 2005).
- Work, Health and Safety Act 2011.
- *How to Safely Remove Asbestos: Code of Practice*. WorkCover 2012.
- *Waste Classification Guidelines Part 1: Classifying Waste.* NSW EPA, December 2014 (EPA 2014).
- *Use and Disposal of Biosolids Products "Stabilisation Grade A Product",* NSW EPA (1997).
- *Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia*, Department of Health Western Australia, May 2009 (DoH 2009).
- Guidelines for the Assessment of On-site Containment of Contaminated Soil, Australian and New Zealand Environment and Conservation Council, September 1999 (ANZECC 1999).

5.2 Extent of contamination

Based on the findings of the previous investigations (JBS 2013, JBS&G 2014) and subject to the limitations of those investigations the extent of contamination is outlined in the following section. The exceedances of the adopted HIL land use criteria are shown in **Figures 7a-7e**.

The boundaries of the remediation area shall be determined by the remedial excavation works. It is possible that contaminated soils, if identified, will require to be additionally chased out from the walls and base of the excavations formed by the removal of the impacted materials.

The known areas of remediation are shown in **Table 5.1** following and in **Figures 8a-8e, 9 and 10.** The exceedances reported, depth and the likely AEC that is the potential cause of the exceedances are provided in **Table 5.1.**

Table 5.1 Description of Remedial Areas

Precinct	Lots	Lot Description	Exceedances Above Adopted Criterion	Concentrations (mg/kg)	Impact Depth (m)	Suspected Source AEC	Further Comments
I	**1/11126 207-217 Boundary Road, Maraylya (#1 on Figure 5a & 7a)**	Residential Property, with several sheds. Stockpiles of building materials were present in the eastern portion of the lot. Several structures appeared to consist of ACM.	EILs: 2x copper, 3x nickel, 8x zinc HILs: 1x Chromium (VI) ACM in soil -4	2 samples from 17 for copper reported above EIL with 410 mg/kg in 1-SS02 (0.0-0.1 m) and 320 mg/kg in 1-A-SS10 (0.0-0.1 m). 3 samples from 17 for nickel above EIL with 63 mg/kg in 1-SS02 (0.0-0.1 m), 33 mg/kg in 1-A-SS10 (0.0-0.1 m) and 31 mg/kg in 1-SS15 (0.0-0.1 m) 8 samples from 17 for zinc above the EIL with 1100 mg/kg in 1-SS02 (0.0-0.1 m), 260 mg/kg in 1-SS04 (0.0-0.1 m), 180 mg/kg in 1-O-SS07 (0.0-0.1 m), 2300 mg/kg in 1-SS18 (0.0-0.1 m), 690 mg/kg in 1-TP02 (0.0-0.1 m), 370 mg/kg in 1-TP04 (0.0-0.1 m). 1 sample from 17 for Cr reported above the HIL-A with 120 mg/kg in 1-SS02 (0-0.1)/ 4 samples from 25 with asbestos in soil (1-SS01 (0-0.1 m), 1-A-SS 09 (0-0.1 m), 1-A-SS20 (0-0.1 m) and 1-A-SS28 (0-0.1 m)). All other results below adopted criteria	0.1 m	Building structures including lead paint flaking	ACM reported in surface soil
I	**1/207750 181-191 Boundary Road, Maraylya (#3 on Figure 5a & 7a)**	Residential Property, with several sheds. Stockpiles of building materials were present including drums. A burnt car was present adjacent to Boundary Road. The site appeared to have been used as a former orchard.	EILs: 1x copper, 3x zinc ACM in soil – 1	1 sample from 27 for copper reported above EIL with 240 mg/kg in 3-S-SS20 (0.0-0.1 m) 3 samples from 27 for zinc reported above EIL with 610 mg/kg in 3-S-SS18 (0.0-0.1 m), 580mg/kg in 3-S-SS20 (0.0-0.1 m) and 380 mg/kg in 3-TP03 (0.0-0.1 m). 1 sample from 14 with asbestos in soil (3-TP03 (0-0.1 m)). -	**# 2, 14, 15, 23, 29 and 31. and 15**	Subject to unexpected finds protocol.					

In addition to these areas, there are anthropogenic materials within fill material that may require remediation and this is outlined in **Section 7**.

Additionally, ASTs present at the site will need to be removed and disposed of in accordance with **Section 7** and the relevant standards.

A total of 20 stockpiles were identified at the site during the previous investigation and will require management during the proposed development. During the inspections completed as part of the previous assessment (JBS&G 2014) none of the stockpiles were reported above 200 m^3.

The known stockpile locations are shown on **Figure 9**. The identified stockpiles are summarised in **Table 5.2** following.

Table 5.2 Known Stockpiles

5.2.1 Data Gaps

In addition to the remedial areas outlined there exists data gap areas at the site and these are discussed further in **Section 4**.

5.3 Possible Remedial Options

The Contaminated Sites: *Guidelines for the NSW Auditor Scheme* (DEC 2006) states that that soil remediation and management is implemented in the following preferred order in NSW:

1. On-Site treatment of the soil so that the contaminant is either destroyed or the associated hazard is reduced to an acceptable level;

2. Off-Site treatment of excavated soil so that the contaminant is either destroyed or the associated hazard is reduced to an acceptable level, after which the soil is returned to the Site;

3. Removal of contaminated soil to an approved Site or facility, followed, where necessary, by replacement with clean fill; and

4. Consolidation and isolation of the soil on-Site by containment within a properly designed barrier.

NEPC (2013) considers that if the first two options above are not practicable, then on-site containment is preferred over removal and disposal, with a further alternative being implementation of a long-term management strategy to manage impacted materials on site where remediation would have no net environmental benefit or would have a net adverse environmental effect.

5.4 Discussion of Options

Within the context of the hierarchy, the development is to be staged. The preferred order of remediation may need to be adjusted for individual lots and Precincts during the staged development process. Due to development process being unknown at this stage one or more of the preferred remediation options may be utilised.

The aim of the development works would be retain as much material as possible to reduce costs and reduce material to be removed to landfill. However, this will be dependent on timing, on whether there is excess spoil or the storage areas for material to be retained at the site.

The preferred approach may change as the development progresses.

Based on the development at the site consisting of various different land uses there is scope to complete the remediation during the construction phase of works within each Precinct. The remediation strategy will consist of several options, including offsite disposal, cap and containment and onsite treatment. The application of these options will be dependent on final development designs within each Precinct but are summarised in the following sections.

5.5 Preferred Remediation Option

The preferred approach would be to retain as much material at the site as possible. With consideration to EPA's endorsed guidelines hierarchy for soil remediation options, a summary of the preferred remediation options are outlined as follows:

- 'Sparrow' picking of ACM from surface soils and disposal of ACM offsite with reuse of treated materials at the site;
- Treated materials to be placed in appropriate areas subject to the finalisation development plans;
- Excavation and offsite disposal of the impacted soils where retention at the site is not possible;
- in-situ containment of impacted soil within road reserves or less conservative land uses where the development plans allow;
- Offsite disposal of hydrocarbon impacts;
- Removal of any liquid within ASTs removed, the ASTs degassed and then removed offsite for appropriate destruction and recycling;
- Hazardous building materials to be removed by an appropriate licensed remediation contractor prior to demolition of the buildings;
- Removal of any surficial debris, such as drums and machinery; and
- Ongoing management through the development and implementation of an Environmental Management Plan (EMP) for the management of the retained contaminated materials where retained/contained onsite.

As the concept plan for the site has been divided into nine Precincts (**Section 2.9**), the remedial strategies can be applied across the site as a whole, or on a staged basis.

Excavation of the remedial areas will be completed based on particular AEC identified as per **Tables 5.1** and **5.4,** with the footprint of the AEC being remediated and validated. Consequently, the remedial areas will be varied in size, with them based on the size of the AEC footprint. Where impacts are associated with buildings, the footprint will be extended by 1 m around the building to assess for potential runoff/flaking paint etc.

The remedial area excavated must be to the depth of the known impact (as described in **Table 5.1**). The excavation will be inspected and should further evidence of impacts (staining, odours etc.) be reported then further excavation will be required, as per **Section 7**. If no further impacts are observed then validation sampling will be completed.

The stockpiles identified will required to be managed/remediated as a whole. The preferred strategy is to retain stockpiles, where appropriate, at the site. Where stockpiles have been identified to contain only ACM impacts then 'sparrow' picking of ACM from the stockpiles is considered an appropriate method for remediation to allow retention at the site without the need for further management (**Section 7.3.2**). Alternatively, the stockpiles can be disposed offsite in accordance with the NSW EPA 2014 or alternatively non 'sparrow' picked impacted stockpiles could also be placed within a containment cell within a designated area and managed under a future long term management plan.

Additionally, all building footprints must be considered during the further assessment, remediation and validation.

Building materials must be inspected and assessed prior to being demolished and demolition waste sent for recycling. An environmental consultant must inspect the material for hazardous building materials (i.e. ACM) and aesthetic impacts prior to being removed offsite for recycling as per the EPA NSW (2014). Materials removed offsite must also be documented in the Validation report.

Based on the unknown development plan for the whole site various remediation strategies could be implemented.

A summary of the remedial strategy for the site is provided in **Table 5.3** following:

Table 5.3 Remedial Approach (by AEC)

AEC	Preferred Option	Contingency
ACM in surface soils	Reuse of material at the site without ongoing management subject to Sparrow Picking	Onsite containment of non-treated impacted materials or offsite disposal
ACM in subsurface soils	Reuse of material at the site without ongoing management subject to Sparrow Picking and Quantification	Onsite containment of non-treated impacted materials or offsite disposal
ACM in stockpiles	Reuse of material at the site without ongoing management subject to Sparrow Picking and Quantification	Onsite containment of non-treated impacted materials or offsite disposal
ACM in farm dams	Reuse of material at the site without ongoing management subject to Sparrow Picking and Quantification	Onsite containment of non-treated impacted materials or offsite disposal
Hydrocarbon HIL impacts (including stockpiles)	Offsite disposal	Onsite bioremediation subject to suitable volumes of material provided
Heavy metal HIL impacts (including stockpiles)	Reuse in less sensitive land use scenarios	Onsite containment of non-treated impacted materials or
Hydrocarbon ESL impact s(including stockpiles)	Offsite disposal	Onsite bioremediation subject to suitable volumes of material
Heavy metal EIL impacts (including stockpiles)	Reuse in less sensitive land use scenarios	Onsite containment of non-treated impacted materials or offsite disposal
Building Rubble (Aesthetic)	Potential Recycling and containment	Offsite disposal
ASTs	Offsite Disposal	-
Surface Debris (Drums, concrete etc.)	Offsite Disposal	-

The remedial strategy for each lot is provided in **Table 5.4** following.

Table 5.4 Remedial Approach (by Lot)

Precinct	Lots	Potential Source AEC	Exceedances Above Adopted Criterion	Further Comments	Further Investigation Required	Preferred Remediation Strategy	Remediation Summary	Validation required
A	15/255616 3 Cataract Road, Box Hill (#24 on Figure 4c)	AST.	EIL: 2x zinc	AST	Investigation beneath AST	Removal of any liquid contents from the AST as per DECCW 2009, Removal and destruction of AST, surface sampling directly beneath AST after removal and remediation (if required) EIL impacts to be managed through excavation, transportation and placement of impacts in areas not designated for landscaped areas.	2x areas for EIL heavy metal impacts associated with metal sheets. Excavate to 0.1 m with footprint of former metal sheets 1x AST area, approx. excavation area 3 m x 3 m x 1 m	AST removal. Removal of hazardous building materials during demolition. Removal of EIL exceedance offsite or placement within less conservative land use areas. Validation of any management of any impacts within dam walls or below AST
		ACM associated with building adjacent	ACM	Wood and corrugated iron ACM in stockpiles	Inspection of ACM across lot	Excavation, pick and reuse of ACM impacted stockpiles or removal offsite.	Stockpiles excavated to footprint and to a 0.1 m bgs (anthropogenic materials & ACM)*	Stockpile to material tracked if to be retained at the site or disposed of offsite. Remove site debris (metal sheets)
		Dam	-	-	Investigation within dam walls	-	-	Validation of any management of any impacts within dam walls

Notes:

***Refer to Section 5.2** and **Table 5.2** for additional detail of stockpile locations and descriptions. As reported in JBS&G 2014, none of the estimated stockpile volumes were reported to be above 200 m^3.

6. Remedial Plan

A summary of the remedial scope of works is provided in the following sections.

6.1 Notifications

Prior to remediation works activities beginning at the site, the local council must be notified of the intent to remediate the site under the Department of Urban Affairs and Planning/EPA SEPP 55 guidelines (DUAP/EPA 1998), as per **Section 13.** Additionally, after the remediation is completed at the site, the council must be notified of the completion of the works.

It is anticipated that the notification to council with be completed during the development application process.

6.2 Define the Boundary of Contamination

The site boundaries are shown on **Figures 1** and **2** and the nine Precincts are shown on **Figure 3**.

The boundaries of the identified remedial areas shall be determined by the observations made during excavation works and validation results. However, based on the observations and analytical testing undertaken as part of the previous assessment (JBS&G 2014) the extent of impacts are outlined in **Section 5.2**.

Table 5.4 outlines the extent of impacts identified that requires remediation and validation at the site.

6.2.1 Data Gaps

As discussed in **Section 4**, there exists data gaps at the site which are to be addressed prior to remediation.

6.3 Expected Sequence of Works

The anticipated sequence of works for the future project, per stage, is expected to be as follows:

- Identification of potential containment cells;
- Confirmation of development of each stage;
- Site Mobilisation;
- Removal of vegetation;
- Draining of dams
- Demolition of buildings;
- Data Gap assessments including confirmatory site inspection;
- Remediation of known impacts;
- Remediation of any unexpected finds;
- Validation sampling of subsequent excavations, unexpected finds etc;
- Reinstatement of any excavations; and
- Final Validation report.

6.4 Site Establishment

An appropriately experienced and licensed contractor is required to undertake the works, under the guidance of an appropriately qualified and experienced environmental consultant.

All safety and environmental controls are to be implemented as the first stage of remediation works.

These controls will include but not limited to:

- Locate and isolate all required utilities in the proximity of the works;
- Work area security fencing, with dust mesh on the fences;
- Site signage and contact numbers;
- Sediment fencing (attached to security fencing); and
- Stormwater runoff and sediment controls (hay bales).

6.5 Demolition of Structures

This RAP does not extend to providing an approach to demolition of structures at the site. However, demolition of structures is required to achieve future landuse objectives, and appropriate validation of the site.

Caution should be taken during demolition to ensure hazardous materials in structures, including identified lead-based paint and asbestos materials are removed appropriately.

Demolition materials should be removed off site for recycling or disposal at appropriately licensed facilities, consistent with the material content. Demolition materials containing ACM or other hazardous materials or contaminants should not be mixed with other demolition materials that are not impacted. Appropriate controls should be in place to protect human health and the surrounding environment, including measures to ensure demolition does not cause contamination of soil, surface water or groundwater.

Where no hazardous materials have been identified in the structures there is potential the materials could be crushed and utilised at the site or placed within containment cells. If the material is to be utilised at the site, the landuse of the propped area must be reviewed to ensure there are no aesthetic risks to the lot from demolition waste.

6.6 Farm Dam Dewatering & Sediment Removal

On the understanding that all water in the dams is to be removed prior to development, any water remaining in the farm dams present at the site will need to be removed. Given that the dams were likely used for agricultural purposes it is proposed to discharge the water to one or more of the creeks running through the site.

Prior to dewatering the Office of Water will need to be contacted in regards to discharging the water. Based on responses from the Office of Water, the water within the farm dams may require testing prior to discharge.

Should testing be requested/required prior to discharge, potential analyses may include the following:

- TPH;
- Heavy Metals;
- pH;
- Ammonia;
- Total Suspended Solids; and
- Biologicals, including E.Coli, Faecal coliforms and salmonella.

Appropriate sediment and erosion controls will need to be implemented prior to discharge to the creek.

Once the water has been removed from the farm dams, inspection and assessment of the dam walls and base should be undertaken, as per **Section 4**. This is further described in **Section 7**.

Samples will be compared against the criteria provided in **Section 8**. Should sample results exceed the adopted site criteria the sediment will either be disposed of offsite or excavated and placed within less conservative areas or within a containment cell. Geotechnical assessment may be required to ensure the material is geotechnically suitable.

6.7 Cap and Containment

As noted previously, there is the potential that on-site containment of impacted material at the site will be required. This is based on the potential for impacted fill material to be placed beneath new roads and pathways constructed as part of the new development and within less sensitive land use scenarios.

Containment of the impacted material and capping should be consistent with relevant EPA made or endorsed guidelines including ANZECC (1999[5]). The requirements are partly dependent on the type of materials and contaminants to be contained, and their relative mobility (potential to leach). Relatively immobile materials, such as asbestos containing material (ACM), and contaminants bound to a matrix such that they do not readily leach, can be contained without the need for impermeable liners, leachate collection and treatment systems or groundwater monitoring. It is these types of materials that are assumed to be proposed for cap and containment at the site.

Leachate analysis, including PAHs and heavy metals within materials to be contained must be analysed for TCLP to identify if they are relatively insoluble to ensure that impacts to groundwater from the site are considered to be low. If completed and found to be relatively insoluble then these materials will be considered to be suitable for cap and containment.

Capping retained contaminated material is required to prevent contaminant exposure to human and ecological receptors on the surface.

The capping should comprise the following minimum requirements:

- A marker layer placed over retained contaminated materials and/or appropriate demolition materials, to identify the top of contained material (and base of capping). A readily identifiable marker layer should be installed to provide adequate visual warning during any future ground disturbance;
- A capping layer of minimum 400 mm thick virgin excavated natural material (VENM) material or validated material from the site and relative compaction level of 85% MDD, and with an appropriate moisture content;
- If in landscaped areas, a growing medium (topsoil) layer of minimum 200 mm thickness should be placed over the capping layer. This topsoil layer should also be placed in loose layers and track-rolled by dozer or equivalent to the required 200 mm thickness and relative compaction level of 85% MDD, and with an appropriate moisture content. This topsoil layer thickness should be able to be vegetated with shallow rooted grasses and/or low shrubs;

[5] Guidelines for the Assessment of On-Site Containment of Contaminated Soils, ANZECC (1999).

- If in the paved areas, under roads or under concrete slab buildings, the new paving will act at the capping layer. Consequently, the paved layer and sub-base is considered to be appropriate for capping of impacted materials.

Based on the potential changes to site levels during development, topography and drainage will need to be considered should vegetation include deeper rooted trees. This containment method would require the implementation of an EMP both for containment within open space areas and under roads.

Should an EMP not be suitable for implementation for the roads, due to Council requirements, then only material above EIL/ESL exceedances will be placed under road reserves to prevent the need for an EMP in these areas only.

6.8 Impacted Materials Remediation Works

The extent of the impacted areas requiring remediation is described in **Section 5** and shown on **Figures 8a-8e**. A variety of remedial strategies are to be utilised within the Precincts, with the following being utilised:

- Excavation, removal and disposal of impacted materials offsite;
- Excavation, removal and placement of impacted materials within road reserves or less conservative land use areas, with material tracking required; and
- Removal of ACM from surface soils by ‘sparrow picking’.

Materials to be disposed off-site require a waste classification in accordance with the Waste Classification Guidelines (EPA 2014). Material tracking will be required for all materials transported on, to and from the site.

6.8.1 Soil Asbestos Remedial Works

The remediation and validation works of any asbestos impacted materials will be supervised by an appropriately qualified and experienced environmental consultant and undertaken by a licensed Class A asbestos removal contractor where friable asbestos is reported or a Class B asbestos removal contractor where non-friable asbestos works are required. Soil remedial works will be completed as per the following Sections.

6.8.1.1 Asbestos ‘Sparrow’ Picking

Asbestos ‘Sparrow’ picking involves the removal of visible non-friable bonded ACM fragments by hand by competent persons. This involves the inspection of an impacted area in 1 m transects and raking the top 0.1 m to identify any visible ACM.

Any suspected ACM is removed, doubled bagged and sealed for offsite removal.

Once raked and following the removal of any ACM for disposal offsite, an inspection will be completed by an experienced and suitably trained environmental consultant. If non-friable ACM is identified by the environmental consultant then further picking is required.

Any asbestos validation works must be completed in accordance with **Section 7.3.**

The aim of this method is to prevent the need for cap and containment as per **Section 6.7.** Picking of the material to below the adopted site criteria (**Section 8**) will allow the material to be retained at the site a depths greater than 0.1 m bgs without the need for management. However, should picking not be completed and material still be retained then it will need to be capped and contained and managed in accordance with an environmental management plan.

6.8.2 Hydrocarbon and Heavy Metal Remedial Works

The remediation and validation works of hydrocarbon and heavy metal impacted materials will be supervised by an appropriately qualified and experienced environmental consultant.

The validation works will be completed as per **Section 7**.

6.8.3 Delineation of Excavations

Where excavation of impacted soils is required, where they are identified either visually, from olfactory detection or through the use of a Photo-ionisation Detector (PID), shall be 'chased' out. This will be conducted under the direction and supervision of JBS&G. The procedure for undertaking this excavation activity will be by:

- Observation of the excavations and identification of potentially impacted soils;
- Excavation of impacted soils to lateral and vertical extent of field based identifiable impact, with additional break up and removal of concrete to remove soils where impact extends laterally until the soils meet the adopted validation criteria (**Section 8**); and
- Soils above the adopted site criteria will be classified as a waste and disposed offsite to an appropriately licensed waste facility or if suitable placed within road reserves and managed.

Excavation of the remedial areas will be completed by having a 10 x 10 m 'square' centred on the remedial area excavated to the depth of the known impact (as described in **Table 5.4**). The excavation will be inspected and should further evidence of impacts (staining, odours etc.) be reported then further excavation will be required. If no further impacts are observed then validation sampling will be completed.

Any unexpected finds will be managed as per **Section 9**.

6.8.4 Backfilling of Excavations

Upon confirmation of excavation validation, excavations will be reinstated using validated material from the site. No importation of VENM or excavated natural material (ENM) is proposed. Should VENM or ENM be required to be imported to the site, this will be completed as per the criteria in **Section 8** and the decision rules provided below in **Table 7.1**. Prior to importation to the site, the material must be assessed (including an inspection at the source site and appropriate sampling and analysis as per **Table 7.3**) by a suitably qualified environmental consultant, with documentation provided for its source, sampling certification and volumes.

Soil material characterisation reports will be reviewed or if no material characterisation provided, soil analytical data will be compared against the EPA endorsed criteria.

If material characterisation reports detail the imported material as VENM, ENM or other material covered by the NSW EPA exemption, or if the soil analytical data meets the above criteria, then the material is considered appropriate to be imported to the site.

If the material is classified as anything other than VENM, ENM or other material covered by the NSW EPA exemption in provided documentation, or it fails the specified criteria, then the material must not be brought to the site.

6.8.5 Offsite Disposal of Material

Impacted soils and ACM removed from remediated soil to be disposed off-Site shall require a waste classification in accordance with EAP NSW (2014) '*Waste Classification Guidelines Part 1: Classifying Waste*'. The potential presence of asbestos in fill materials must be noted in the preparation of the waste classification.

Stockpiles observed at the site on the have the potential to be retained, however, each stockpile of material must be tracked as to its final placement location.

Material to be removed offsite will be either loaded directly into trucks for offsite disposal or stored on hardstand to prevent cross contamination. All material will require material tracking.

6.8.6 Imported Fill Material

If required, VENM, ENM, or any other suitable material granted an applicable EPA Exemption under the Protection of the Environment Operations (Waste) Regulation 2014 may be imported to reinstate the excavations. Prior to importation to the site, the material must be assessed (including an inspection at the source site and appropriate sampling and analysis as per **Table 7.3**) by a suitably qualified environmental consultant, with documentation provided for its source, sampling certification and volumes.

6.8.7 Stockpiles

As discussed in **Section 5**, several lots contain stockpiles that require management. Each individual stockpile is required to be assessed for beneficial reuse in less sensitive areas. All stockpiles must be inspected for aesthetic suitability if to be reused at the site.

All material will require material tracking whether it be retained at the site or disposed of offsite at a suitable facility.

If stockpiles are to be removed for offsite disposal then they will require sampling and classification in accordance with the EPA 2014 waste guidelines.

6.9 Environmental Management Plan (EMP)

Should impacted material be retained at the site, then an environmental management plan (EMP) will be required to manage these impacts.

6.10 Air Monitoring

During any asbestos remedial works, perimeter air monitoring will be conducted. Air monitors will be set up on each of the perimeter boundaries within that particular work area.

Air monitoring will be conducted in accordance with the requirements of the National Occupational Health and Safety Commission (NOHSC) Asbestos Code of Practice and Guidance Notes, in particular, the Guidance note for the estimation of airborne asbestos fibres [NOHSC 3002:2005].

6.11 ASTs

Petroleum infrastructure identified must be removed.

Prior to the removal of the ASTs, any liquid within the AST must be pumped out by a licensed contractor and disposed of off-site as “liquid waste” in accordance with DECCW (2009).

The environmental consultant will provide supervision and validation during any petroleum infrastructure removal process. Where removal is required, the following process is to be followed:

- Observation of AST and associated fuel infrastructure excavations and identification of impacted soils;
- Observation of excavation of impacted soils to lateral and vertical extent of physically identifiable impact, with additional removal of soils where impact extends laterally and vertically; and
- Observation of impacted soils transferred to a soil stockpiling area on the site.

7. Validation Plan

Validation will be required for the following areas:

- Validation of excavations from where heavy metal, hydrocarbon and asbestos impacted soils have been removed;
- Validation of the ACM removed from the surface soils at the site;
- Validation of the removal of aesthetic issues, including ACM, stockpiles, staining and other anthropogenic materials.
- Removal of ASTs present at the site;
- Validation of footprints of stockpiles of excavated impacted material prior to being removed from the site;
- Validation of the removal/containment of impacted stockpiled materials;
- Validation of any material placed beneath road reserves or cap and contained;
- Validation of former building footprints;
- Validation of any unexpected finds identified during the remedial works; and
- Validation of any material imported to backfill the sites excavations.

7.1 Data Quality Objectives

Data quality objectives (DQOs) were developed for the validation assessment, as discussed in the following sections.

7.1.1 State the Problem

Asbestos, heavy metal and hydrocarbon impacted in-situ soils and stockpiles have been identified at the site. The identified areas require remediation followed by validation of residual soils to ensure impacted material that may pose an unacceptable level of risk to site users or an ecological risk to the surrounding environment has been successfully managed during remediation works.

7.1.2 Identify the Decision

The following decisions are required to be made during the validation works:

- Are there any unacceptable risks to future on-site receptors from any residual soil contamination following the remediation of contaminated soil or within former buildings footprints and/or retained buildings?
- Are there any aesthetic (stains/odours/asbestos) issues at the site?
- Have all data gaps been addressed?
- Has material disposed of offsite been classified in accordance with the EPA 2014 and been transported to an appropriately licensed facility?
- Has any impacted material been retained at the site and has it been suitably managed in accordance with the requirements of the RAP?
- Did any material imported on to site as backfill meet the requirements of the RAP?
- Is there any potential migration from the site?
- Is ongoing management of residual contamination necessary?

7.1.3 Identify Inputs to the Decision

The inputs to the decisions are:

- Physical observations, including visual, olfactory and PID screening results during site activities;
- Documentation to verify appropriate removal and disposal of waste;
- Soil analytical data from samples collected from the base and walls of excavations formed by the removal of impacted soils; and
- Survey plans to verify appropriate cap and containment of any remaining impacted soils and excavation areas and site boundaries.
- The soil validation acceptance criteria adopted for the landuses.

7.1.4 Define the Boundary of Impact

The individual identified remedial areas are shown on **Figures 8a-8e**.

The vertical extent of the remediation will be determined during the excavation works but further investigation works could be completed prior to ascertain the full extent of impacts, based on observations made by the environmental consultant.

7.1.5 Develop a Decision Rule

Soil analytical data will be assessed against EPA published / endorsed criteria for constituents:

- National Environment Protection (Assessment of Site Contamination) Measure, National Environment Protection Council, 2013 (2013).
- Guidelines for the NSW Site Auditor Scheme 2nd Edition, April 2006 (NSW DEC 2006);
- Waste Classification Guidelines. Part 1: Classifying Waste, NSW EPA, November 2014 (EPA 2014).

7.1.6 Summarise Decision Rules

The decision rules adopted to answer the decisions identified in **Section 7.1.2** are summarised in **Table 7.1.**

Table 7.1 Summary of Decision Rules

Decision Required to be made	Decision Rule
1. Are there any unacceptable risks to future on-Site receptors from any residual soil contamination following the remediation of contaminated soil and within former buildings footprints and/or retained buildings??	Soil analytical data will be compared against EPA endorsed criteria. Statistical analyses of the data in accordance with relevant guidance documents will be undertaken, if appropriate, to facilitate the decisions. The following criterion will be adopted with respect to soils: the reported concentrations are all below the Site criteria depending on landuse; If the criterion stated above is satisfied, the decision is No. If the criterion stated above is not satisfied, the decision is Yes. Statistical analyses of the data in accordance with relevant guidance documents will be undertaken, if appropriate, to facilitate the decisions. The following statistical criteria will be adopted with respect to soils: Either: the reported concentrations are all below the site criteria; Or: the average site concentration for each analyte must be below the adopted site criterion; no single analyte

Decision Required to be made	Decision Rule
	concentration exceeds 250% of the adopted site criterion; and the standard deviation of the results must be less than 50% of the site criteria. And: the 95% upper confidence limit (UCL) [6] of the average concentration for each analyte must be below the adopted site criterion. If the statistical criteria stated above are satisfied, and an assessment of risk indicates no unacceptable risks, the decision is No. Otherwise, the decision is Yes.
2. Are there any aesthetic (stains/odours etc.) issues at the site?	If there are any unacceptable odours and/or discolouration (or other aesthetic indicators) the answer to the decision is Yes. Otherwise, the answer to the decision is No.
3. Have all data gaps been addressed?	As per decision rule 1.
4. Has material disposed of offsite been classified in accordance with the EPA 2014 and been transported to an appropriately licensed facility?	Soil analytical data will be compared against EPA endorsed criteria. Statistical analyses of the data in accordance with relevant guidance documents will be undertaken, if appropriate, to facilitate the decisions (as detailed above). Appropriate waste classification and disposal documents to be obtained. If the statistical criteria stated above are satisfied, the decision is Yes, or if receipts are provided recording the disposal of material to an off-site licensed facility, the decision is Yes. If criteria or statistical assessment or no disposal receipts are provided, the answer is No.
5. Has any impacted material been retained at the site and has it been suitably managed in accordance with the requirements of the RAP?	Material placed in the containment cells will be documented, with the capping layer material tracking documentation to be provided If the documentation is not provided then the answer is No. If the documentation is provided and is suitable then the answer is yes.
6. Did the material imported on to site as backfill meet the requirements of the RAP?	Soil material characterisation reports will be reviewed or if no material characterisation provided, soil analytical data will be compared against the EPA endorsed criteria. If material characterisation reports detail the imported material as VENM, ENM or other material covered by a NSW EPA waste exemption, or if the soil analytical data meets the above criteria, the answer is Yes. If the material is classified as anything other than VENM ENM or other material covered by a NSW EPA waste exemption in provided documentation, or it fails the specified criteria, the answer is No.
7. Is there any potential migration from the site?	Soil contaminant data was evaluated with the consideration of the potential for migration of contaminants via bulk disturbance of soils (ie. Dust, surface water, etc) and the potential mobility of contaminants in soil and groundwater. In the event that significant contaminant concentrations was identified and there is the potential for migration of these contaminants from the site via either bulk movement and/or migration in soil and/or groundwater, the answer to the decision was Yes. Otherwise, the answer to the decision was No..

[6] *Sampling Design Guidelines.* (NSW EPA,1995)

Decision Required to be made	Decision Rule
10. Is ongoing management of residual contamination necessary?	Was the answer to any of the above decisions Yes? If yes, a site management strategy may be required. If no, a site management strategy was not required.

7.1.7 Specify Limits of Decision Error

Specific limits for this project have been adopted in accordance with the appropriate guidance from the NSW EPA, NEPC (2013), DEC (2007), appropriate indicators of data quality (DQIs used to assess quality assurance / quality control) and standard JBS&G procedures for field sampling and handling.

To assess the usability of the data prior to making decisions, the data will be assessed against pre-determined Data Quality Indicators (DQIs) for completeness, comparability, representativeness, precision and accuracy. The acceptable limit on decision error is 95% compliance with DQIs.

The pre-determined Data Quality Indicators (DQIs) established for the project are discussed below in relation to precision, accuracy, representativeness, comparability, completeness and sensitivity (PARCCS parameters), and are shown in **Table 7.2**.

Precision – measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples for chemical COPCs. For asbestos precision is assessed by whether the identification results for duplicate samples were in agreement with the original sample.

Accuracy – measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards. Note only applied to chemical COPC.

Representativeness – expresses the degree which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the Site, and by using an adequate number of sample locations to characterise the Site to the required accuracy.

Comparability – expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples; and ensuring analysing laboratories use consistent analysis techniques; and reporting methods.

Completeness – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.

Sensitivity – expresses the appropriateness of the chosen laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted Site assessment criteria.

Table 7.2 Summary of Data Quality Objectives for Soil Validation Program

Data Quality Indicator	Frequency	Data Quality Criteria
Precision		
Blind duplicates (intra laboratory) Chemical analysis	1 / 20 samples	70-130%
Blind duplicates (inter laboratory) Chemical analysis	1 / 20 samples	70-130%
Asbestos Duplicates		Asbestos analysis in agreement
Accuracy		
Laboratory control samples	1 per lab batch	<LOR
Surrogate spikes	1 per lab batch	70-130%
Matrix spikes	1 per lab batch	70-130%
Representativeness		
Sampling appropriate for media and analytes	All samples	All samples
Samples extracted and analysed within holding times – asbestos	All samples	No holding time
Rinsate	1 per sample batch	<LOR
Trip spike	1 per sample batch	70-130%
Trip blank	1 per sample batch	<LOR
Comparability		
Standard operating procedures for sample collection & handling	All Samples	All samples
Standard analytical methods used for all analyses	All Samples	All samples
Consistent field conditions, sampling staff and laboratory analysis	All Samples	All samples
Limits of reporting appropriate and consistent	All Samples	All samples
Completeness		
Soil description and COCs completed and appropriate	All Samples	All samples
Appropriate documentation	All Samples	All samples
Satisfactory frequency and result for QC samples	All QA/QC samples	-
Data from critical samples is considered valid	-	Critical samples valid
Sensitivity		
Analytical methods and limits of recovery appropriate for media and adopted Site assessment criteria	All samples	LOR<= Site assessment criteria

Notes: 1 – If the RPD between duplicates is greater than the pre-determined data quality criteria, a judgment will be made as to whether the excess is critical in relation to the validation of the data set or unacceptable sampling error is occurring in the field.

7.1.8 Optimise the Design for Obtaining Data

The purpose of this step is to identify a resource-effective field investigation sampling design that generates data that are expected to satisfy the Site manager's decision performance criteria, as specified in the preceding steps of the DQO Process. The output of this step is the sampling design that will guide development of the field sampling and analysis plan. This step provides a general description of the activities necessary to generate and select data collection designs that satisfy decision performance criteria.

Validation will be undertaken as per the following sections.

7.2 Soil Validation Methodology

7.2.1 Soil Sampling

A suitably qualified person trained and experienced in the identification of asbestos, will be required to undertake the sampling. It should be noted that a licensed asbestos assessor will be required for the validation of any friable asbestos impacted soils.

Soil samples are proposed to be collected from the walls and base of the excavation generated by the removal of the impacted soils.

Impacted soils, where they are identified either visually, from olfactory detection or through the use of a PID, shall be 'chased' out. This will be conducted under the direction and supervision of an environmental consultant. The procedure for undertaking this excavation activity will be as follows:

- Observation of excavations and identification of impacted soils;
- Excavation of impacted soils to lateral and vertical extent of physically identifiable impact, with additional removal of soils where impact extends laterally and vertically; and
- Impacted soils transferred to a soil stockpiling area on the site or directly loaded into a truck for offsite disposal or movement for placement beneath road reserves/less sensitive land uses.

Samples should be targeted at the original exceedance depths. New nitrile gloves will be used to collect each sample. Soil samples will be immediately transferred to sample containers of appropriate composition, which are supplied by the testing laboratory. All sample containers will be clearly labelled with a sample number, sample location, sample depth, sample date and samplers initials. The sample containers will then transferred under chain-of-custody conditions to the testing laboratory. The samples will be analysed at a laboratory NATA accredited for the required analyses. Additionally, asbestos samples will be collected in accordance with current NEPM 2013 guidelines, with 500 mL samples collected.

As per the requirements of each of the remediation areas outlined in **Section 5.2**, a square around each of the remediation areas will be excavated to the target depth, as required in the previous RAP. The excavation will be inspected prior to sampling of the walls and base of each of the excavations for the relevant COPCs.

Soil samples will be screened on Site during works using a photo-ionisation detector (PID) to assess the presence of volatile organic compounds (VOCs) including petroleum hydrocarbons. Samples collected from locations targeting heavy metal impact will be screened using an x-ray fluorescence (XRF) unit.

7.3 Asbestos 'Sparrow Picking'

As discussed in **Section 6**, Where asbestos fragments have been reported within the surface soils (<0.1 m) and/or subsurface soils (>0.1 m), within stockpiles and farm dams, there is potential that asbestos 'sparrow' picking can be completed to allow for the material to be retained at the site without the need for placement under road reserves or other less sensitive areas.

It should be noted that the quantification of the amount of asbestos within the subsurface soil areas and stockpiles identified to contain asbestos fragments will need to be completed to confirm whether the picking method is appropriate. The asbestos quantification methodology is provided in **Section 7.3.3**.

7.3.1 Surface Pick

Where visible asbestos has been reported in the surface soils (<0.1 m) only, a surface pick will be completed. Prior to the surface pick, vegetation clearance should be completed for the inspections to be completed.

This will involve the walking of a designated area in 1 m perpendicular transects by suitably trained and experienced competent persons, with raking of the top 0.1 m completed. All ACM will be bagged and double sealed for disposal offsite in accordance with the EPA 2014.

Once completed an environmental consultant will inspect the area for visible asbestos with the process being repeated should visible asbestos be reported. Should the environmental consultant continue to observe visible ACM, after the third failure the surface material will be deemed unsuitable and will need to be excavated and either placed under road reserves/less sensitive landuses or disposed of offsite.

7.3.2 Subsurface

Where non-friable impacts extend deeper than the surface soils, the material can be excavated and ACM picked to acceptable levels for retention at the site under road reserves and/or less sensitive landuses.

The material would need to be excavated, followed by placement and spreading of material on approximately 10 m x10 m pads in layers, approximately 0.1 m thick.

The material placed in pads will be hand raked and inspected for the presence of ACM by a team of labourers trained in asbestos identification. Any ACM collected will be removed for off-site disposal at a suitably licensed facility. Each pad will be raked and inspected individually, with material for each pad tracked.

Once raked and following the removal of any ACM for disposal offsite, an inspection will be completed by an experienced and suitably trained environmental consultant. If non-friable ACM is identified at levels that exceed the relevant criteria by the environmental consultant then the process will be repeated until validation criteria are achieved, or a decision is made to remove the material for on-site containment or off-site disposal on the basis the process is deemed unlikely to achieve validation.

The material will be sampled at a rate of one 500 mL sample per 10 m^3, prior to being cleared for reuse. The 500 mL sample will be collected by the environmental consultant and analysed at NATA accredited laboratory for the presence/absence of asbestos.

Should the consultant determine the soil is grossly impacted by ACM (such that it is not practicable to reduce ACM to acceptable levels by picking), or if asbestos fibres (AF/FA) are detected above the limit of reporting of 0.1g/kg in the analysed soil sample(s), and/or if friable asbestos is observed at any time during the inspection process, the materials will be removed to a separate stockpile area for offsite disposal at a suitably licensed facility to accept the waste or contained appropriately on site. This material must be kept separate from non-asbestos impacted soils and will be tracked on-site.

Where the environmental consultant verifies ACM content is below the criteria in subsurface soils and no asbestos fibres (AF/FA above criterion) are detected in the collected soil samples, the material will be considered suitable for reuse on-site. It is noted that subsurface ACM impacted soils that have been validated following this process must be placed at depths greater than 0.1 m bgs where visible ACM is still present albeit at acceptable levels meeting validation criteria.

7.3.2.1 Asbestos Picking Pad Footprints

Subsequent to the picking process for subsurface soils, the pads will require validation. An inspection for visible ACM and collection of validation samples will be required to ensure no impacts remain in the pads. Samples will be collected on 10 m grid from each pad area. Should the samples contain friable asbestos the material will be excavated and disposed of offsite or placed in an area designated for containment. Should visible ACM be observed, the surface will be picked as per **Section 7.3.1**.

7.3.3 Asbestos Quantification

As discussed in **Section 7.3.1**, asbestos quantification is required to assess the concentration of visible ACM that will require 'sparrow picking'. The methodology for asbestos quantification, in accordance with the NEPC 2013 guidelines, is outlined below:

- Test Pits excavated on a 10 m grid across the impacted area of an individual lot or where ACM impacts are detected in stockpiles or dam materials. Test pits to be completed by trained and experienced environmental consultant;
- Material will be inspected for visual bonded ACM fragments;
- A 100 L sample will be collected of the representative materials observed within each test pit;
- Where more than one distinct material type is observed, separate asbestos calculations must be completed for each material type;
- The 100 L sample will be weighed using a calibrated balanced scale and the weight in kilograms (kgs) recorded; and
- The 100 L sample will be sieved using a 7 mm sieve and any ACM fragments retained in the sieve will be collected, photographed, double bagged and then weighed using the calibrated scales.

Based on the NEPC 2013 guidelines the quantity of asbestos in soil may be estimated using the following equation:

- %w/w asbestos in soil = % asbestos content x bonded ACM (kg) /soil volume (L) x soil density (kg/L).

The results of the equations for each strata will be compared with the adopted criteria in **Section 8**.

7.4 Additional Assessment

To close the data gaps outlined in **Section 4**, there are several areas that require further sampling and assessment.

Soil samples will be collected as per **Section 7.2** and compared against the relevant guidelines outlined in **Section 8**.

7.5 Stockpile Sampling

As discussed in **Section 5**, should the material in stockpiles be potentially suitable for re-use at the site from an environmental perspective, including aesthetic impacts, then the material will be assessed in accordance with the criteria in **Section 8.**

If stockpiles are to be removed for offsite disposal then they will require sampling and classification in accordance with the EPA 2014 waste guidelines.

The known stockpile locations are shown on **Figure 9**. Should further stockpiles be identified subsequent to this RAP or if waste classification sampling is required, sampling is to be completed as per **Table 7.3.**

7.6 ASTs

Petroleum infrastructure identified must be removed and validated.

Prior to the removal of the ASTs, any liquid within the AST must be pumped out by a licensed contractor and disposed of off-site as "liquid waste" in accordance with EPA (2014).

Known AST locations are shown on **Figure 10**.

The environmental consultant will provide supervision and validation during any petroleum infrastructure removal process. Where removal is required, the following process is to be followed:

- Observation of AST and associated fuel infrastructure excavations and identification of impacted soils;
- Observation of excavation of impacted soils to lateral and vertical extent of physically identifiable impact, with additional removal of soils where impact extends laterally and vertically; and
- Observation of impacted soils transferred to a soil stockpiling area on the site.

Following the removal of the AST and infrastructure, the following validation works are proposed to be completed by the environmental consultant:

- Inspection, collection and screening (by PID) of validation samples taken from the base and walls of the excavation and any fuel lines following removal of AST; and
- Assessment by collection and screening (by PID) of validation samples of excavated material for off-site disposal.

Where stained and/or odourous soil around the ASTs are observed, then further assessment is required to assess potential for leaks. Test pits will be completed using an excavator with samples collected within and below the identified impacts. Further validation will be required for delineation sampling.

Test pit samples will be analysed for heavy metals, TPH/BTEX, volatile organic compounds (VOCs) and PAHs.

Samples will be collected as outlined in **Section 7.2** and analysed as per **Table 7.3.**

7.7 Management of Landscaped Areas

Where future landscaping is to occur, it is assumed that growing media will be imported to the site that meets the VENM requirement or any other exemption provided by the NSW EPA, i.e. ENM. The importation of growing media will reduce the risk to plant life in the landscaped areas.

Material tracking must be completed to ensure that ecological impacts are not placed within the top 2 m within the landscaped areas. Material tracking is to be completed by the appointed environmental consultant, with no ecological impacts identified, as per **Section 7**, being placed within landscaped areas. The identified areas of ecological impacts must be either placed under 2 m of validated material or beneath roadways/footpaths to restrict access to flora and fauna.

7.8 Cap and Containment

Materials above adopted site criteria for landuse scenarios or have not been treated may be placed within a designated area identified during development that will require ongoing long term management through an EMP. The cap and containment will be completed as per requirements in **Section 6.8**.

Materials to be contained within a containment cell must have TCLP analysis completed to ensure protection of groundwater.

Material tracking is to be completed by the appointed remediation contractor, with the environmental consultant to validate the source and placement.

7.9 Less Sensitive Land uses

Materials that contain concentrations of COPCs that meet the landuse scenario are suitable to be placed without the need for future management. Materials to be potentially placed in areas of less conservation land uses or within road reserves, with TCLP analysis required to ensure protection of groundwater.

Material tracking is to be completed by the appointed remediation contractor, with the environmental consultant to validate the source and placement.

7.10 Hazardous Building Materials and Asbestos Clearance

Prior to demolition a hazardous building materials assessment will be required for each building. An assessment will also be required on the heritage listed buildings remaining at the Site.

The survey must be completed by an experienced hazardous material survey auditor and the following materials included in the survey:

- asbestos;
- synthetic mineral fibres;
- lead based paint; and
- polychlorinated biphenyls.

The asbestos survey will take the form of a visual inspection by experienced staff of the building. Samples will be taken as appropriate and analysed for asbestos using stereobinocular microscopy and polarised light microscopy with dispersion staining by a laboratory that is accredited with the National Association of Testing Authorities.

The presence of lead paint will be assessed through visual inspection of painted surfaces during the inspection as required and using XRF equipment. No allowance has been made for laboratory analysis of lead paint.

Electrical appliances that may have PCB-containing capacitors will be identified by visual inspection. Representative samples of each type of light fitting or electrical appliance will be inspected and the make and model of the capacitor compared with the ones listed in the Australian and New Zealand Environment and Conservation Council (ANZECC) document Identification of PCB-Containing Capacitors.

Hazardous building footprints were assessed within the previous assessment (JBS 2012), however, further assessment after demolition will be completed. Soil samples of the former building footprints are proposed to be collected on a 20 m linear grid, with visual assessment of ACM included.

Footprint samples of the former buildings will be collected as per the requirements in **Table 7.3**.

7.11 Debris and Anthropogenic Materials

During construction works there is potential for anthropogenic materials to be identified throughout the site. Should extensive anthropogenic materials, including animal remains, be reported then assessment, including visual inspection and validation sampling, by the environmental consultant in accordance with the criteria in **Section 8** will be required.

If the material meets the adopted landuse criteria then there is potential that the material and debris can be separated for disposal offsite and/ or recycled, as appropriate.

Vegetation removed, if not impacted with asbestos, can be re-used on site as composting material and placed where required.

If material does not meet the adopted criteria then the material remediation strategy will completed as per **Section 5**.

7.12 Laboratory Analyses

All laboratories engaged for the project will need to be NATA accredited for the required analyses.

In addition, each laboratory is required to meet internal QA/QC requirements consistent with NEPM. Laboratory analysis of samples will be conducted with reference to COPCs listed in **Table 7.3**.

The proposed soil validation sampling and analytical program for impacted soils is outlined in **Table 7.3**.

Table 7.3 Sampling and Analytical Schedule

Validation Area	Sampling Frequency	Analytes
Excavations formed by the removal asbestos impacted soils	1 validation sample per 10 m linear of walls and 1 base validation sample per 25 m^2 (at least 1 sample per wall and base required)	Asbestos (500 mL)
Asbestos Surface ACM	NA	Inspection for ACM
Subsurface ACM picking and Pads	1 sample per 10 m^3 pads	Asbestos (500 mL)
Excavations formed by the removal heavy metal impacted soils	1 validation sample per 10 m linear of walls and 1 base validation sample per 25 m^2 (at least 1 sample per wall and base required)	Heavy metals including As, Cr, Cu, Cd, Pb, Ni, Hg and Zn
Excavations formed by the removal of hydrocarbon impacted soils	1 validation sample per 10 m linear of walls and 1 base validation sample per 25 m^2 (at least 1 sample per wall and base required)	PAHs, TPH
Cap and Containment	1 sample per 100 m^3	TCLP – PAHs, metals
Further Stockpile Sampling (for additional stockpiles generated)	1 sample per 25 m^3 up to 200 m^3 (i.e. min 8 samples in 200 m^3) 1 sample per 100 m^3 and inspection for aesthetic impacts	Asbestos (500 mL), 8 metals, PAHs, metals, TPH/BTEX
Footprints of all stockpiles	1 sample per 10 m (or 100 m^2) and inspection for the presence of ACM	8 metals/TPH/BTEX PAH, Asbestos (500 mL)
Imported Soils (VENM)	Minimum of 3 samples per source Site (and inspection, consistent with **Sections 6.8.4 and 6.8.6**)	8 metals/TPH/BTEX PAHs/OCPs/PCBs Asbestos (500 mL)
Imported Soils (ENM)	Consistent with ENM Exemption 2012 (or subsequent revisions) for characterisation	8 metals, TPH, PAHs, chlorinated hydrocarbons, Ph, RTA T276 foreign materials*, asbestos (500 mL)
Hydroponic Footprint (assumed 500 m^2)	5 samples	Asbestos (500 mL), 8 metals, OCPs, herbicides
ASTs	1 validation sample per 10 m linear of walls (if excavation required >0.1 m) and 1 base validation sample per 25 m^2 (minimum of 5 samples per)	PAHs, TPH/BTEX, VOCs, 8 metals
Building footprints (after demolition)	1 sample per 20 m and inspection for the presence of ACM	OCPs, Asbestos (500 mL), lead, PCB
Farm Dams	1 sample per 50 m for wall and inspection for the presence of ACM. 1 sample per 2500 m^2 for base. At least 1 sample per wall and base required	TPH, OCPs, asbestos (500 mL), 8 metals, biologicals, ammonia, Ph
Surface Debris	Visual Inspection of removal of materials including metal, machinery and animal remains	-
Dog Kennels	As per **Section 4**	
Animal Remains	As per **Section 4**	
6 Lots	As per **Section 4**	
Groundwater	None Proposed	-

*NSW Roads & Traffic Authority Test Method T276 Foreign Materials includes rubber, plastic, bitumen, paper, cloth, paint and wood.

8. Validation Criteria

Given the intention to develop the site for mixed land use, including residential, commercial and open space, soil results will be compared against the validation criteria stipulated in **Table 8.1**. The validation criteria are based upon the guidelines provided in NEPC (2013).

The remaining criteria are based on EPA endorsed investigation levels which, while being used as clean-up levels instead of site-specific criteria derived through a process of risk assessment, are considered adequately conservative for the purposes of validating the site.

Validation within lots will be based upon the landuses as per the development plans of the Precincts, as per **Figure 3**.

Table 8.1 Adopted Site Criteria

	Limit of Reporting	Laboratory Method	Health Investigation/ Screening Levels

All forms of asbestos	Presence	PLM / Dispersion Staining	No visible ACM for surface soil (0 – 0.1 m bgs).			

Notes:

1. Guideline values presented are for Chromium (VI) in absence of total Chromium values. Where total Chromium results are elevated, representative samples will be analysed for Chromium (VI).
2. Guideline values are for inorganic mercury. Where elevated mercury concentrations are encountered and/or site information suggests the potential presence of elemental mercury and/or methyl mercury, consideration of applicability would be needed.
3. Carcinogenic PAHs calculated as per Benzo(a)pyrene Toxicity Equivalent Factor requirements presented in NEPC (2013)
4. Total PAHs calculated as per requirements presented in NEPC (2013).
5. Soil Health Screening Levels for Vapour Intrusion: Clay Soils. Values presented are those for 0 to <1 m bgs as the most conservative level.
6. Values for F1 C6-C9 are obtained by subtracting BTEX (Sum) from laboratory result for C6-C9 TRH.

The ecological guidelines adopted for the site are shown in **Table 8.2**. The ecological criteria are based on site-specific soil properties including pH, cation exchange capacity (CEC) and clay content reported in the DSI (JBS&G 2014), consistent with NEPC (2013) guidance.

Table 8.2 Ecological based criteria

	Limit of Reporting	Laboratory Method	ESLs Urban Residential and public open space	ESLs Commercial and industrial

OCPs				
DDT	0.1	GCECD (USEPA8140,8080)	180	640

1. Values for F1 C_6-C_9 are obtained by subtracting BTEX (Sum) from laboratory result for C_6-C_9 TRH.
2. Value for Chromium (III) adopted for evaluation of total Chromium in the absence of known Chromium (VI) source.

Biological data collected during the assessment, where required, will be compared against the NSW EPA (1997[7]). The criteria is in **Table 8.3** below:

Table 8.3 Biosolids Based Criteria

Parameter	Standard
E.Coli	<100 MPN per g (dry weight)
Faecal Coliforms	<1,000 MPN per g (dry weight)

[7] Use and Disposal of Biosolids Products “Stabilisation Grade A Product”, NSW EPA (1997).

After consideration of the ESLs and HSLs, the Management Limits for TPH fractions (F1-F4) in soil can be reviewed and applied if required. The management limits are shown in **Table 8.4** below:

Table 8.4 Management Limits Criteria

TPH Fraction	Soil Texture	Management Limit (mg/kg dry soil)	
		Residential, parkland and public open space	Commercial and Industrial
F1 C_6-C_{10}	Coarse	700	700
	Fine	800	800
F2 >C_{10}-C_{16}	Coarse	1000	1000
	Fine	1000	1000
F3 >C_{16}-C_{34}	Coarse	2500	3500
	Fine	3500	5000
F4 >C_{34}-C_{40}	Coarse	10000	10000
	Fine	10000	10000

During redevelopment of the site any soil to be removed off-site shall require a waste classification in accordance with EPA (2014) 'Waste Classification Guidelines Part 1: Classifying Waste'. The potential presence of asbestos in fill materials must be noted in the preparation of the waste classification. The waste classification guidelines are in **Table 8.5** following:

Table 8.5 Waste Classification Guidelines based on SCC without TCLP

	Limit of Reporting	General Solid Waste	Restricted Solid Waste
METALS			
Arsenic	2.0	100	400
Cadmium	0.4	20	80
Chromium (VI)	5.0	100	400
Copper	5.0	-	-

DDT + DDD + DDE	0.175		
POLYCHLORINATED BIPHENYLS			
Total PCBs	0.5	<50 (Scheduled waste)	<50 (Scheduled waste)

Note: Concentrations in **Table 8.4** are contaminant threshold values (CT1 & CT2 or SCC1 & SCC2 values where CT1 & CT2 are not used) for classifying waste by chemical assessment without the leaching (TCLP) test (EPA 2014).

8.1 Application of Soil Criteria

For soil to be considered as validated (i.e., not posing an unacceptable risk) all reported concentrations must be below the Site remediation criteria. Should results be found to be able the adopted criteria, then sstatistical analyses of the data in accordance with relevant guidance documents will be undertaken, if appropriate. If the statistical results are below the site criteria then the results will be considered acceptable.

In addition, consideration shall be given to the presence of odorous or discoloured soils (caused by contamination), and other aesthetic issues.

8.2 Validation Reporting

The development of the site is likely to be a staged approach, with the remediation likely to be completed in conjunction with the construction stages. In the event that the remedial works are required to be reported in a staged manner, the Validations Reports shall be stand-alone documents relating to particular stages (areas) of the site.

At the completion of the remedial works for each stage, each Validation Report will be prepared in general accordance with the NSW EPA Guidelines for Consultants Reporting on Contaminated Sites (OEH 2011), documenting the works as completed. Each report will contain information including:

- Confirmation that hazardous materials formerly within the buildings have been appropriately removed and disposed offsite;
- Details of the remediation works conducted;
- Information demonstrating that the objectives of the RAP have been achieved, in particular the validation sample results and assessment of the data against both the pre-defined data quality objectives and the remediation acceptance (validation) criteria;
- Information demonstrating compliance with appropriate regulations and guidelines;
- Any variations to the strategy undertaken during the implementation of the remedial works;
- Cap and containment details, where relevant, including survey data;
- Hazardous building material surveys for all buildings prior to demolition;
- Details of impacts associated with building structures being remediated;
- Waste tracking documentation from the receiving facility;
- Details of any environmental incidents occurring during the course of the remedial works and the actions undertaken in response to these incidents; and
- Other information as appropriate, including requirements (if any) for ongoing monitoring / management.

The report will serve to document the remediation works for future reference.

Should the works not be staged, then a single Validation Report will be prepared documenting all of the above.

9. Contingency Plan

A review of remediation works has been undertaken to identify potential risks to meeting the site validation criteria. A number of potential risks have been identified. These are listed following with contingencies that will be implemented to ensure that validation criteria are met.

9.1 Changing/Staged Development Requirements

As noted in Section 4, development may need to adjust the remedial approaches as development designs change and final site requirements adjust as development progresses. As such contingency remediation approaches may be required, consistent with **Table 5.4**.

9.2 Unexpected Finds

The possibility exists for hazards other than those identified and expected based on previous investigations, to be present at the Site.

Environmental sampling is based on chemical analytes identified as a potential concern during a documented process of reviewing historical Site activities. However, ground conditions between sampling points may vary, and further hazards may arise from unexpected sources and/or in unexpected locations. The nature of any additional hazards which may be present at the Site are generally detectable through visual or olfactory means, for example:

- Previously unidentified asbestos fibre impacted soils and ACM;
- Drums or underground tanks;
- Chemical bottles;
- Odorous or unusual coloured soils; and
- Buried animal remains.

As a precautionary measure to ensure the protection of the workforce and surrounding community, should any of the abovementioned potential hazards be identified (or any other unexpected potentially hazardous substance), the procedure summarised in **Flowchart 9.1** and detailed in the following sections is to be followed.

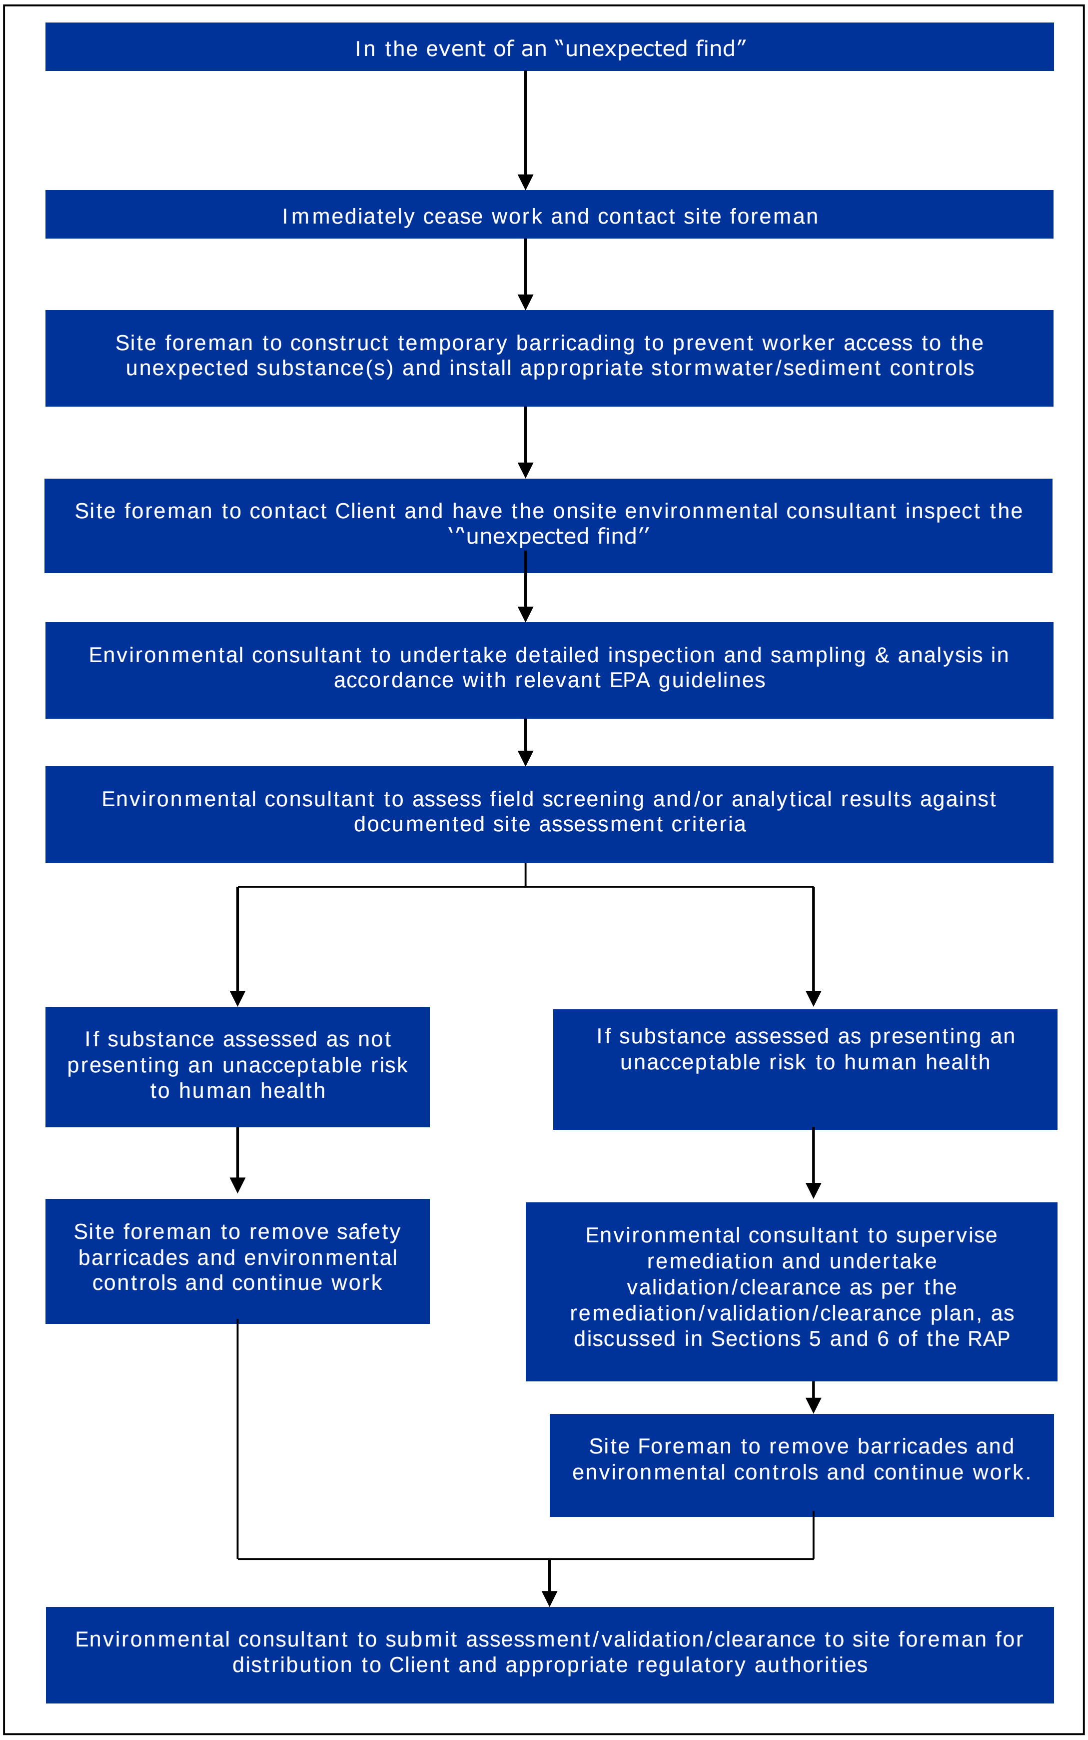
An enlarged version of the unexpected finds protocol, suitable for use on Site, should be posted in the Site Office and referred to during the Site Specific Induction by the Principal Contractor.

The sampling strategy for each 'unexpected find' shall be designed by a suitably qualified environmental consultant, in accordance with guidelines made or endorsed by EPA. The strategy will, however, be aimed at determining the nature of the substance – that is, is it hazardous and, if so, is it at concentrations which pose an unacceptable risk to human health or the environment.

The sampling frequency of the identified substance / materials shall meet the requirements the NSW EPA Sampling Design Guidelines (1995).

Should any unexpected finds require remediation and validation, the works will be conducted in general accordance with Sections 5 and 6 of this RAP, and with appropriate measures based on the nature of the unexpected find. The Auditor should be advised and discussions held to confirm the appropriate remedial strategy for the unexpected find.

Flowchart 9.1 Unexpected Find Protocol



10. Site Management Plan

Hours of Operation

Remediation works shall only be permitted during the following hours:

Monday to Friday: 7:00 am to 3:00 pm

Saturdays: 8:00 am to 1:00 pm

Sundays and Public Holidays: No work permitted.

Emergency work is permitted to be completed outside of these hours. The works schedule will require confirmation with Council.

10.1 Soil and Water Management

All works shall be conducted in strict accordance with the soil and water management measures outlined in this section.

To prevent the migration of impacted soil/sediment off site, silt fences shall be constructed at the down-gradient work area boundaries, as per the specifications contained in *Managing Urban Stormwater – Soil and Construction Volume 1, 4th Edition, NSW Government*, March 2004. Any material which is collected behind the sediment controls shall be treated as potentially contaminated and will be suitably managed.

In a storm event, the sediment controls located on-site will need to be monitored and replaced or altered if necessary. Collected material will need to be suitably managed in accordance with remediation works.

10.2 Site Access

During remediation works, perimeter fencing will be maintained to restrict access to the works area. Only authorised persons will be able to enter the works area.

Vehicle access to the works area shall be stabilised to prevent the tracking of soil around the site and the adjoining driveway/access point to the road will be swept or cleaned on an as-needed basis. Any collected materials shall be treated as potentially contaminated and will be suitably managed.

10.3 Stockpiles

The following procedures will be implemented:

- No stockpiles or other materials shall be placed on footpaths or roadways and will be away from all stormwater infrastructure (including drainage lines, stormwater pits, gutters, etc) where possible. Where this is not possible, sediment controls will be placed over stormwater grates to prevent ingress of sediment to stormwater drainage lines;
- Stockpiles shall be formed with sediment control structures placed immediately down slope to protect other lands and waters from sediment pollution;
- All stockpiles likely to generate substantial dusts or potential asbestos fibres shall be covered and, if left for more than 24 hours, be stored in a secure area; and
- All stockpiles will be placed on a level area as a low elongated mound.

10.4 Dam & Excavation Pump-out

The farm dams and excavation pump out water (if any) shall be pumped from the excavation by a licensed contractor and disposed of off-Site as 'liquid waste' in accordance with DECC (2009).

10.5 Noise

The remediation works shall comply with the NSW EPA's Environmental Noise Control Manual for the control of noise from construction sites.

All machinery and equipment used on site will be in good working order and with the fitted with appropriate silencers when necessary.

10.6 Vibration

The use of plant and machinery shall not cause vibrations to be felt or capable to be measured at the neighbouring premises.

10.7 Air Quality

10.7.1 Dust Control

During the remediation of the impacted areas, dust levels will be monitored and minimised by using mist sprays as necessary.

During the removal of the asbestos impacted materials from the site, the excavation area will be wetted down using a water spray to minimise the potential for dust to be generated. In addition to these controls, air sampling will be conducted during the asbestos remediation works to monitor the amount of airborne asbestos fibres released. The monitoring results will be used to adjust the work technique, in particular the amount of water used to wet the excavation.

Dust shall also be controlled by ensuring vehicles leave via the designated (stabilised) site access and all equipment has dust suppressors fitted.

10.7.2 Asbestos Air Monitoring

Asbestos air monitoring will be completed in accordance with **Section 11.4**.

10.8 Material Transporting

Trucks will be loaded in a designated area away from the contaminated material excavations. The transporting contractor shall ensure that there is no material tracked out onto the street and that the load is securely covered. In addition, all site vehicles must leave the site in a forward direction.

All appropriate road rules shall be observed and state roads will be selected as far as practicable over local roads when deciding on the transport route to the off-site material disposal location.

Where material is to be imported, controls are to be implemented to maintain separation between contaminated and non-contaminated materials.

10.9 Hazardous Materials

All hazardous and/or intractable wastes (if any) shall be removed and disposed of in accordance with the relevant regulatory requirements. In particular, any hazardous wastes will be transported by an EPA licensed transporter.

10.10 Disposal of Contaminated Soil

All soil will be classified, managed and disposed in accordance with the Waste Classification Guidelines Part 1: Classifying Waste (DECC 2009a).

10.11 Imported Fill

If any materials are required to be imported on site to re-establish existing ground levels, then only material meeting the requirements outlined in **Section 6.8.4** will be accepted onto the site.

10.12 Site Signage and Contact Numbers

A sign shall be displayed throughout the duration of the works with the contact details of the remediation contractor and project manager. Council shall also be notified of these details at least 14 days prior to commencing works.

10.13 Complaint Reporting and Resolution

Complaints from adjoining site occupants or workers on site will be directed initially to the civil contractor on site. Following that, discussion with the environmental consultant and the complainant will investigate the issue and remedy it as required or applicable.

11. Health and Safety

The objectives of the health and safety plan are:

- to apply standard procedures that reduce risks resulting from the above works;
- to ensure all employees are provided with appropriate training, equipment and support to consistently perform their duties in a safe manner; and
- to have procedures to protect other Site workers and the general public.

These objectives will be achieved by:

- assignment of responsibilities;
- an evaluation of hazards;
- establishment of personal protection standards and mandatory safety practices and procedures; and
- provision for contingencies that may arise while operations are being conducted at the Site.

This health and safety section does not provide safety information specific to construction and other demolition or excavation activities carried out by contractors, such as the safe operation, maintenance and inspection of plant, etc. Contractors will be required to prepare their own Safe Work Method Statements for their work activities. All parties working on the Site shall comply with all applicable Health and Safety legislation, regulations, codes and guidelines.

Health and safety requirements while working with asbestos will be decided by the asbestos removal contractor and will be based on the requirement of their licence. Measures implemented by the licensed asbestos removal contractor will take precedence over the advice provided herein.

11.1 Responsibilities

11.1.1 Remediation Supervisor

The remediation supervisor is responsible for ensuring that the work is carried out in accordance with the health and safety plan. This will include:

Ensuring a copy of the health and safety plan is available at the Site during the remediation/validation activities;

Confirming individuals are competent in performing allotted tasks;

Liaison with the contractor representatives, as appropriate, regarding safety matters; and

Investigation and reporting of incidents and accidents.

The remediation supervisor will be designated by the nominated contractors prior to the commencement of Site remediation works.

11.1.2 Other Members of the Site Workforce

Every individual worker is responsible for conducting their allocated tasks in a safe manner and in accordance with their training and experience. They must give due consideration to the safety of all others in their proximity and cooperate in matters of health and safety. All workers must leave their work areas in such a condition that the location will not be hazardous to others at any time.

11.2 Hazards

The known or potential hazards associated with the work activities are listed below:

Inhalation hazards associated with the presence of asbestos containing materials.

- Chemical hazards associated with the presence of contaminated soil;
- Physical hazards, including:
- work in or near excavations;
  - operating machinery;
  - heat stress and UV exposure;
  - underground or overhead services;
  - manual handling; and
  - noise.

In the event of the discovery of any condition that would suggest the existence of a situation more hazardous than anticipated, or of any new hazard that could potentially cause serious harm to personnel or the environment, work will be suspended until the Remediation Supervisor has been notified and appropriate instructions have been provided to field personnel.

11.2.1 Inhalation Hazards

The main inhalation hazards from the remediation/validation works are consequent of the presence of asbestos, hydrocarbons and heavy metals.

Measures require to be put in place to prevent/ minimise the generation of airborne fibres and odours. These have been described in the environmental controls for the works. Where airborne emissions are generated, PPE shall be required to be worn to prevent potential exposure.

11.2.2 Physical Hazards

Operating Machinery

Heavy plant and equipment operating in the vicinity of field personnel presents a risk of physical injury. Personnel should be cognisant of their position in relation to operating machinery at all times. Personnel must wear high visibility clothing when onsite.

Never walk behind or to the side of any operating equipment without the operator's knowledge. Do not assume that the operator knows your position. Personnel should stay at least 1 m from the operational area of heavy equipment and should not stand directly below any load or piece of equipment (e.g. backhoes, excavators, vehicles).

Work In or Near Excavations

No Site personnel are to stand closer than 0.5 m to the edge of an excavation. No Site personnel are to enter excavation greater than 1 m deep. Additionally, at the end of each day excavations are to be barricaded to prevent access.

Cuts and Abrasions

The manual work associated with the remediation works gives rise to the risk of cuts and abrasions to personnel working in the area. As well as the direct consequences of any cut or abrasion, such injuries can lead to the possibility of exposure to contaminants through the wound as well as diseases such as tetanus. To minimise the risk of direct or indirect injury, personnel will wear the personal protective equipment described.

Heading: Heat Stress and UV Exposure

Site personnel may experience heat stress due to a combination of elevated ambient temperatures and the concurrent use of personal protection equipment; this depends in part on the type of work and the time of year.

In addition to heat stress, overexposure to UV radiation in sunlight can result in sunburn to exposed skin. The use of a high protection sunscreen (SPF15 or greater) on all exposed skin is recommended. Hats (including hard hats in specified areas) will also provide additional sun protection during the peak (i.e. 10:00 am to 3:00 pm) sun period. Sunglasses should be worn (where appropriate) to protect eyes from effects of UV exposure.

Underground Services

There is the potential for underground services (electricity, natural gas lines, water, telephone, sewer, and stormwater) to be present beneath the work area. The remediation contractor shall ensure that appropriate procedures will be taken to minimise the risk associated with excavation near services.

Aboveground Electrical Hazards

All electrical plant and equipment must comply with the requirements of Australian Standard AS 3000. Hand held portable tools shall comply with AS/NZS 3160 "hand-held portable electric tools" and shall be double insulated. Cord connected portable hand lamps shall comply with AS/NZS 3118. A Residual Current Device (RCD) shall protect plug-in portable equipment, which is connected to a supply above Extra Low Voltage - 12-24volts (including equipment supplied from a generator or welding set). RCD protection shall be provided during maintenance of portable electrical equipment at all times while the equipment is connected to a power supply above Extra Low Voltage, irrespective of whether power is switched ON or OFF. RCD's shall comply with AS 3190 and shall be type II units, rated to trip at or below 30 milliamps within 40 milliseconds.

In the vicinity of overhead power lines, the WorkCover NSW 'Guidelines for Working Near Overhead Power Lines' (2006) should be consulted to determine the appropriate 'approach distance' specific to the line voltage present and tasks under completion. No excavator, drill rig or crane may work within the nominated 'approach distance', unless specifically approved by the Remediation Supervisor and/or the asset owner if required.

Manual Handling

When lifting or handling heavy objects, use correct lifting techniques, bending the knees not the back. If the item to be lifted is too heavy or awkward for one person to lift, seek assistance from other company employees or use mechanical help.

Noise

Long-term exposure to high levels of noise is unlikely. However, operating machinery may cause significant noise exposures for short periods. Earplugs or earmuffs should be worn in any situation where noise levels make normal conversation difficult.

11.3 Personal Protective Equipment

All workers who may come into direct contact with contaminated soil will wear the following personal protective equipment:

- Overalls or long sleeved collared shirt;
- Heavy duty outer gloves (e.g. leather) where there is a risk of cuts or abrasions, otherwise PVC outer gloves if in direct contact with contaminated soil;

- Steel capped boots;
- Safety glasses;
- High visibility vest or jacket; and
- Hard hat.

In addition to the above, the following personal protective equipment will be worn by the licensed personnel responsible for removing the asbestos impacted soils, or potentially exposed to airborne emissions:

- During any work in the asbestos impacted area prior to final clearance, overalls worn should be made from either 100% synthetic material or a mixed natural/synthetic fabric capable of providing adequate protection against fibre penetration. Gloves, rubber soled work shoes or gum boots should be provided for personnel involved in the wet work. These shoes will remain inside the work area for the duration of the work.
- Approved respirators shall be worn in the asbestos impacted area at all times to provide respiratory protection. The minimum protection is an approved properly fitting disposable respirator or half faced respirator fitted with a particulate cartridge. However it is expected that the contractor will conduct a risk assessment in relation to the works and should consider the requirement for positive pressure, hood or full-face powered air-purifying respirator fitted with an approved Class M filter.
- The contractor shall supply and keep in good order, two complete sets of protective clothing and respirators for authorised inspection personnel. These will remain the property of the contractor at the end of the contract.
- Respirators should be issued for personal use only and shall be kept in a clean condition. Alcohol based antiseptic swabs should be made available for the cleaning of respirators.
- Any respirator defects should be reported for subsequent repair. They should be maintained in a clean and safe working condition.
- Employees must receive instruction in the correct method of using the respirator and on the importance of correct facial fit and maintenance. No person with a beard shall be allowed within the asbestos work area except using an approved positive pressure continuous airflow hood.

It is further noted that additional PPE may be required as part of the WorkCover permitting process. If this occurs, then the above PPE requirements will be upgraded to reflect WorkCover's requirements.

- In the event that workers will be exposed to highly odorous soil conditions during remediation works, the following additional PPE should be adopted:
- Impermeable disposable overalls; and
- Half or full face respirator with organic vapour cartridge.

11.4 Monitoring procedures

It is prudent practice to conduct monitoring for airborne asbestos fibres during asbestos works. The results of air monitoring can be used:

- To identify failures in containment;
- To identify poor work practices; and

- To provide proof of containment for occupiers and regulatory authorities and to provide evidence of good work practices for both present and future needs.

Monitoring will be conducted in accordance with the National Occupational Health & Safety Commission (NOHSC) membrane filter method as approved by the National Association of Testing Authorities (NATA).

The appropriate TWA (NOHSC) levels are:

- AmoSite - 0.1 fibre/mL;
- Chrysotile – 0.1 fibre/mL;
- Crocidolite - 0.1 fibre/mL;
- Other forms of asbestos - 0.1 fibre/mL; and
- Any mixture of these, or where the composition is unknown - 0.1 fibre/mL.

With consideration to these levels the following trigger levels have been developed:

- If airborne fibre levels reach 0.01 fibres/mL the source of fibre release is to be found and rectified. Work in the affected area does not have to stop; and
- If airborne fibre levels reach 0.02 fibres/mL work in the work area should stop and additional controls measures employed. This will involve additional water spraying during excavations.

Proposed air monitoring locations will be located in areas where asbestos impacted material has been identified.

Air monitoring results will be obtained within 24 hours of sample collection. While this precludes "real time" monitoring, visual indications will be made during all excavation works and, if there is any visible dusts, light water spays will be used to wet the excavation and prevent the release of any airborne asbestos fibres.

11.5 Decontamination Procedures

The decontamination procedures specified below will be followed whenever personnel, plant or equipment leave the Site.

Personnel

The following steps should be taken to ensure personnel do not leave the Site with potentially contaminated clothing:

- Wash boots in clean water
- Remove outer gloves and store for reuse
- Remove overalls and store for reuse (during the day) or place in the skip for the asbestos wastes for disposal.
- Remove respirator and goggles (if used) and store clean for reuse or decontamination, as appropriate.
- Thoroughly wash hands and face.

If any part of a worker's body comes into direct contact with any potentially contaminated material, the affected part(s) should be immediately washed with clean water.

Vehicle, Plant and Equipment

All equipment, including personal protective equipment, will be washed or otherwise cleaned to ensure that contaminated soil, water or dust is removed before it leaves the Site. All plant and equipment will have their outer bodies thoroughly cleaned of soil and sediment before moving off the Site.

11.6 Emergency Response

The remediation contractor will be responsible for preparing an emergency response plan, which will provide details on appropriate action and evacuation procedures in the event of an emergency.

In the event of an emergency arising on the Site, appropriate action should be taken. Site evacuation procedures should be followed, as necessary.

In the event of an accident: evaluate the seriousness of the injury, and contact emergency services, if necessary; provide first aid, as appropriate, and if safe to do so evacuate the injured person; make the area as safe as possible without jeopardising safety.

If a serious accident occurs, do not disturb the scene, except to make safe and prevent further injury or damage, and keep all unauthorised people out, and report all accidents to the Remediation Supervisor.

12. Post Remediation Site Management Plan

12.1 Long Term Management Plan

Subsequent to implementation of the preferred remediation strategy, and demonstration of successful validation of the site in accordance with the requirements of this RAP, a long term Environmental Management Plan (EMP) may be required for the management of any impacted materials exceeding criteria retained at the site.

Due to the various Precincts having different landuse scenarios, implementation of an EMP will only be required where impacted materials are retained that exceed specific landuse criteria.

Should all impacted material be remediated, either through offsite disposal or placement within road reserves or less sensitive landuse scenario locations then an EMP will not be required subject to auditor sign off and approval.

13. Regulatory Approvals/Licensing

State Environment Planning Policy Number 55 (SEPP55) Remediation of Land

The proposed remediation works are considered to be classified as 'Category 1' Remediation Works – i.e. requiring consent based on more than 3 ha of area is to be disturbed during the development and likely to be ancillary to the development and therefore part of the overall development process. The notification requirements of SEPP 55 include notification to Council 30 days before Category 1 remediation works commence. The notification will provide Council with the information needed to verify the work.

Protection of the Environment Operations Act 1997

In relation to the licensing requirements under the Protection of the Environment Operation Act 1997:

- The works do not fall within the licensing requirements for Contaminated Soil Treatment Works; and
- The works do not fall within the licensing requirements for Crushing, Grinding or Separating Works.

All material to be excavated and removed from the Site (including associated activities such as classification) will be undertaken in strict accordance with the requirements of the POEO Act 1997. Such requirements include:

- Ensuring waste is classified appropriately and in accordance with relevant guidelines;
- Waste materials are disposed of to appropriately licensed facilities;
- Other materials are removed to facilities lawfully able to accept such materials.

Waste Classification Guidelines, Part 1: Classifying Waste

All wastes generated shall be classified and managed in accordance with the NSW DECC Waste Classification Guidelines Part 1: (2009).

Asbestos Removal Regulations and Code of Practice

The removal and disposal of asbestos will be managed in accordance with the National Occupational Health & Safety Commission (NOHSC) Asbestos: Code of Practice and Guidance Notes, the Work Health and Safety Act 2011, WorkCover Guidelines and the NSW EPA Waste Classification Guidelines 2009. Friable asbestos works must be completed by a licensed Class A asbestos removalist. Non-friable asbestos remediation works can be completed by a Class B licensed contractor.

Before starting the affected works, a Site-specific permit approving the asbestos works must be obtained from NSW WorkCover. A permit will not be granted without a current licence and the permit application must be made at least seven days before the work is due to commence.

Work Health and Safety Act 2011

The overarching Act for NSW setting law relating to employee health and safety and employer responsibilities.

Work Health and Safety Regulation, 2011

Sets Regulations and details the duties for employers to achieve required employee health and safety performance.

Environmental Planning and Assessment Act 1979 (EP&A Act)

The EP&A Act provides a framework for the development of land within NSW, including division of planning responsibilities between tiers of government and requirements for assessment in relation to development of sites for specific uses. This act provides for the enforcement of conditions upon use of the land via planning instruments including state environmental planning policies such as SEPP 55.

Contaminated Land Management Act 1997 (CLM Act)

The CLM Act controls the assessment of contamination and management of contaminated soils and groundwater. The Act also contains guidance for the determination of whether a site is considered to be a Significantly Contaminated Site and allows for accreditation of Site Auditors.

Protection of the Environment Operations Act 1997 (POEO 1997)

The POEO Act provides a regulatory framework for matters affecting the environment including environmental protection measures. The act provides for the licensing of activities with the potential to cause harm to human health and/or degradation of the environment, including waste disposal.

14. Site Suitability

Subject to the successful implementation of the measures detailed in this RAP and subject to the limitations in **Section 15**, it is considered that the identified impacted soils can be remediated and validated without the need for further management.

However, as discussed in **Section 12**, should material above the adopted land use scenario criteria be retained in specific areas of the site, then an environmental management plan will be required to manage the potential risk to future site users for the particular containment area of the site.

15. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only, and has been based in part on information obtained from the client and other parties.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose.

JBS&G accepts no liability for use or interpretation by any person or body other than the client who commissioned the works. This report should not be reproduced without prior approval by the client, or amended in any way without prior approval by JBS&G, and should not be relied upon by other parties, who should make their own enquires.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Ground conditions between sampling locations and media may vary, and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the subsurface conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site, and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.
